

## **Energy Conservation and the Architect: Part 2**

*In this second part of our look at the architect and energy conservation, we present a case history showing how architects can cut energy to fourteen per cent of normal requirements; a table showing some of the major considerations in energy saving and finally, some current examples of alternative energy sources — including recent Canadian work in solar energy. As with Part 1, presented in February 1977, our author is architect John Hix.*
