SUFFERING OVER**

ctors Advised An Opera-  
on. How She Escaped  
Told By Herself.

cker, Mo. "For more than a year  
suffered agonies from female troubles  
and the doctors at last decided there  
was no help for me unless I went to the  
hospital for an operation. I was awfully  
against that operation, and as a last  
resort wrote to you for special advice  
and I told you just what I suffered with  
bearing down pains, shooting pains in my left  
side and at times I could not touch  
the floor without screaming, short of  
breath, had smothered, felt dull and  
draggly all the time, did not do any work,  
and oh how I longed to have an operation.

received a letter full of kind advice  
which I followed, and if I had only  
known her a year ago I would have been  
so much suffering, for today I am  
a woman. I am now keeping house  
and do every bit of my own work.  
One in this part of the country  
it was Lydia E. Pinkham's Vegetable  
Compound that has restored me to  
health, and everywhere I go I recom-  
mend it to suffering women."—Mrs.  
J. M. Scott, Buckner, Mo.

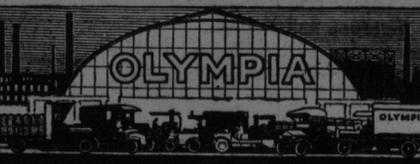

you want special advice write to  
Lydia E. Pinkham Medicine Co. (confi-  
dential) Lynn, Mass. Your letter will  
be read, and answered by a  
physician and held in strict confidence.

## AGRICULTURE

### HOW SHEEP OWNERS MAY RECEIVE COMPENSATION FOR DAMAGES BY DOGS

#### The New Provincial Act Providing For Local Dog Tax Laws

Outside the laws relating to the rural highways, the agricultural legislation of the recent session of the Provincial Legislature consists of only two acts. One of these amends article 1963 of the Revised Statutes, 1909, by providing that the maximum bonus to dairy syndicate inspectors shall be \$150, instead of \$100. The other act is the Sheep Owners' Compensation Fund Act. It is as follows:  
1. The following section and articles are inserted in the Revised Statutes, 1909, after section XXIIA as enacted by the act 2 George V, chapter 41, section 1:  
"SECTION XXII B.  
"THE CREATION OF A COMPENSATION FUND FOR THE BENEFIT OF PROPRIETORS OR POSSESSORS FOR DAMAGE DONE TO THEIR SHEEP."  
"5954. 1. The council of a rural village or town municipality shall pass a by-law to the effect hereinafter mentioned, if called upon so to do by a petition signed by a majority of the rate-payers residing in the municipality.  
"The by-law shall be passed at the ordinary meeting next following the receipt of the petition, or at any other ordinary or special meeting, after the giving of the usual notice required by the law governing the municipality.  
"2. The by-law shall provide:  
"a. For the establishment of an annual compensation fund consisting of the proceeds of an annual tax of one dollar imposed for each dog, and of four dollars for each bitch at large within the limits of the municipality.  
"b. For the imposition of the above tax payable by the proprietor or possessor of any dog or bitch at large in the municipality.  
"c. To compel the owner or possessor of any dog or bitch to declare to the secretary-treasurer of the municipality the number of dogs or bitches under his care, under penalty of a fine of ten dollars recoverable by the municipality for the benefit of the compensation fund;  
"d. For the payment out of the special fund, of compensation for damage done to sheep by dogs or bitches, so soon as the owner or possessor of the dog has proven to the council that such damage has been sustained, notwithstanding the council shall not allow compensation of more than five dollars for any one sheep.  
"e. For a rebate at the end of any tax year, the precise date whereof must be mentioned in the by-law, to the proprietors or possessors of dogs or bitches who have paid the tax, of their proportionate share in the unexpended balance of the compensation fund, except the sums arising from penalties and damages collected by the municipality in virtue of articles 5954d, which damages and penalties shall continue to form part of the compensation fund for the following year.  
"f. That should the fund in any year not continued, for the benefit of the municipality.  
"5955. The municipality may claim in its own name the penalty mentioned in sub-paragraph c of paragraph 2 of article 5954, as well as the amount of the real damage suffered by the complainant to whom compensation of not more than five dollars has been paid in virtue of article 5954e. The municipality is subrogated by operation of law, in the rights of any person who has received an indemnity of not more than five dollars, as regards his recourse against the owner or possessor of the dog or bitch who has caused the damaged suffered by such person.  
"The proceeds of the penalty and of the damages shall be paid into the compensation fund out of which the costs in case the municipality fails in its action shall be paid, subject to the obligation to pay the balance of the costs if the compensation fund is insufficient to meet all the requirements of this section.  
"5956. The by-law mentioned in this section may be passed every year or contain a clause to the effect that it shall remain in force from year to year until repealed.  
"Nevertheless in the latter case the rebate shall be made at the end of each year as if the by-law had been passed for one year only."  
2. This act shall come into force on the day of its sanction.

### POULTRY KEEPING AS AN OCCUPATION FOR WOMEN.

As time goes on, outdoor occupations of various kinds are gradually being taken up by women, and we are daily hearing more and more about the successes they are making in the lighter branches of farming, such as poultry and bee keeping, and sometimes fruit culture. I prepared notes for setting hens, and got the incubator ready by giving it a good airing, and disinfecting well with a boiling hot 10 p. c. carbolic solution. The first batch of set were the best I selected from some that had been gathered several days prior to my arrival.  
During the past summer I spent six months on a large farm, situated about thirty miles from Toronto. While there I had charge of the poultry, and although meeting with a few difficulties and disappointments, and making many mistakes, I was able to carry out my plans pretty successfully, so I am writing this in the hope that you, my readers, may find the story of my experiences beneficial in helping you to avoid the pitfalls that I and so many others have encountered.  
I arrived at the farm on the second of April, and began operations next day, with a flock of chickens consisting of forty-three White Wyandotte hens and pullets, thirty Black Orpingtons, and last but not least three Pekin ducks and a drake; also an equipment of a cement hen-house, 14 x 8 movable colony house, one outdoor brooder, three small A-shaped chicken coops, and a one-hundred egg incubator of rather a poor type, and somewhat the worse for wear. My experience with the feathered tribe had been quite limited, at least as far as dealing with incubators was concerned, but with a longing to go into it on a larger scale, I set to work with determination to make the thing "go" to the best of my ability. My first thought was to rear as many chickens and ducks as I could from the materials which were at hand. To me there seemed to be boundless acres of land. The surroundings were almost ideal for the work. There were splendid shipping facilities to Toronto, the Railway station being on the farm. The orchard of two acres, and a ten-acre corn-field, where the rearing was done, were very conveniently situated near the house and barn, and afforded unlimited range for the growing stock. In addition to this there was the running stream so valuable and necessary for the welfare of the breeding ducks, which at the same time provided drinking water for the hens.  
My first work was to sort over the Wyandottes, it having been decided to keep this breed only. About ten of the poorest-looking hens were culled out, and two penna made of the remaining ones, mating each pen with a cockerel of good vigorous constitution. I prepared notes for setting the hens, and got the incubator ready by giving it a good airing, and disinfecting well with a boiling hot 10 p. c. carbolic solution. The first batch of set were the best I selected from some that had been gathered several days prior to my arrival.

While there I had charge of the poultry, and although meeting with a few difficulties and disappointments, and making many mistakes, I was able to carry out my plans pretty successfully, so I am writing this in the hope that you, my readers, may find the story of my experiences beneficial in helping you to avoid the pitfalls that I and so many others have encountered.  
I arrived at the farm on the second of April, and began operations next day, with a flock of chickens consisting of forty-three White Wyandotte hens and pullets, thirty Black Orpingtons, and last but not least three Pekin ducks and a drake; also an equipment of a cement hen-house, 14 x 8 movable colony house, one outdoor brooder, three small A-shaped chicken coops, and a one-hundred egg incubator of rather a poor type, and somewhat the worse for wear. My experience with the feathered tribe had been quite limited, at least as far as dealing with incubators was concerned, but with a longing to go into it on a larger scale, I set to work with determination to make the thing "go" to the best of my ability. My first thought was to rear as many chickens and ducks as I could from the materials which were at hand. To me there seemed to be boundless acres of land. The surroundings were almost ideal for the work. There were splendid shipping facilities to Toronto, the Railway station being on the farm. The orchard of two acres, and a ten-acre corn-field, where the rearing was done, were very conveniently situated near the house and barn, and afforded unlimited range for the growing stock. In addition to this there was the running stream so valuable and necessary for the welfare of the breeding ducks, which at the same time provided drinking water for the hens.  
My first work was to sort over the Wyandottes, it having been decided to keep this breed only. About ten of the poorest-looking hens were culled out, and two penna made of the remaining ones, mating each pen with a cockerel of good vigorous constitution. I prepared notes for setting the hens, and got the incubator ready by giving it a good airing, and disinfecting well with a boiling hot 10 p. c. carbolic solution. The first batch of set were the best I selected from some that had been gathered several days prior to my arrival.  
During the past summer I spent six months on a large farm, situated about thirty miles from Toronto. While there I had charge of the poultry, and although meeting with a few difficulties and disappointments, and making many mistakes, I was able to carry out my plans pretty successfully, so I am writing this in the hope that you, my readers, may find the story of my experiences beneficial in helping you to avoid the pitfalls that I and so many others have encountered.
