On Face, Arms and Hands. Cuticura Heals.

"I have had saft rheum for the past five years. My face, arms, and hands broke out all over in rough scaly patches so that you could hardly put your finger where there was not a patch. I got so I could not aleen at night. not sleep at night.

"Seeing Cuticura Soap and Oint-ment advertised I thought I would give them a trial, and after using a full-sized box of Cuticura Ointment with the Cuticura Soap I was healed." (Signed) Mrs. Thomas Hogan, Essex Junction, Vt., Dec. 18, 1918.

Use Cuticura for every-day toilet purposes. Bathe with Soap, soothe with Ointment, dust with Talcum.

Scap 25c, Ointment 25 and 50c, Sold throughout the Dominion. Canadian Depot: Lymans, Limited, St. Paul St., Montreal, Cuticura Scap shaves without mug.

the distances rather than use any more precise measure, and, as far as accuracy is concerned, this will usually be satisfactory; but if the tractor pulls three or more plows, cutting a total width of 3 or 3½ feet or more, some effort should be made to have each distance an exact multiple of the total width of the plow, so that the last trip across the field will multiple of the total width of the plow, so that the last trip across the field will exactly cut out the land or finish it to the fence. This will do away with the necessity of making a trip across the field, probably over the plowed ground, to turn over a narrow strip possibly only a few inches in width. It is usually hard to handle the tractor in finishing out such a strip, and it takes at least as much time as it would to plow one of full width

as it would to plow one of full width.

Some recommend that an A frame of
the same width as the total width of the plows be used for measuring all distances. Then whatever the total width of the land is, the last trip will exactly finish it.

A Babcock Tester—A Necessity in Every Dairy.

EDITOR "THE FARMER'S ADVOCATE":

The value of milk and cream, together with their finished products, like many other articles, depends entirely on their composition and not upon the name which is given them. My mind reverts to a conversation between two ladies who were conversation between two ladies who were speaking with reference to a young doctor. One said: "I consider him a model gentleman," inferring of course, that he was a standard of type from which all parties of that sex might take a copy in ambition to reach the highest aspirations of manhood; but the sarcastic reply was this: "Model, I should say—a small imitation of the real thing!" Now we frequently run across a like imitation; very often it is found in restaurant cream jugs, and it may be called ant cream jugs, and it may be called cream or it may be called milk, but we have come to the definite conclusion that it is skim-milk. You are all aware of just what would happen if you under of just what would happen it you undertook to add pure water to milk as it originally is; first you would be paid for this water at the same rate per pound as for milk, and secondly, when it was found out it would cost you a few hundred dollars to straighten up matters with the authorities. Besides, all your neighbors would know that the pump helped materially in bringing up the record of materially in bringing up the record of your herd. Nevertheless, this is practically what is taking place in dozens of communities where milk is not paid for by test. Did you ever realize that you may be selling good fat at the price of water?

If the milk be used for buttermaking, its value, as the fat alone is used in the manufacture of this product. Ordinarily milk differs radically in composition, even among an individual herd of cattle which may be cared for and fed identically; therefore, it is essential that the one purchasing the milk be aware of the relative amounts of the more important constituents. As in other materials, the proper way to ascertain this is by making chemical analysis, but to comprehensively analyze milk samples to secure absolutely accurate results would require an expensively equipped laboratory, an expert chemist, and finally the process would be entirely too slow for commercial purposes. Besides, it is easily seen that an effort to carry this on in the farm dairy would be suicidal. To overcome this difficulty there came into use a means known as the Babcock method. This was invented by Dr. S. M. Babcock, of the Wisconsin Experimental Station. It became known to the American public in 1890, and has been universally used since that date as a test for the fat content of milk. It is rapid, reliable, accurate, and inexpensive,
