cessively every year upon the same land, both the crop and the land will be greatly improved, insomuch that some grounds, which would yield but 5 bushels to the acre at first, have in time produced a crop of 15 bushels, without the charge of manure; but this will not be the case unless the soil is naturally of a good quality, and the stubble be completely turned under, immediately after reaping. If the ground is suffered to remain after harvest without being ploughed till the stubble is dried and shrivelled so that it possesses but little substance, and the seeds of weeds have had time to ripen, the crops of grain in each succeeding year will be diminished, and the weeds will take an almost exclusive possession of the soil. Rye may be sown in the Autumn to great advantage for green fodder, for cattle and sheep, particularly in the spring. Ewes and Lamb will derive much benefit from it.
