JUNE—The many years we have been of opinion that the very best time to cut grass, and secure the greatest amount of nutriment, is after the first hay-making and the seed begins to fall. It is not possible to secure the whole crop when it is just at this stage of ripeness, and every farmer who has considerable of a crop to secure should begin as soon as the grass is in bloom, and even then a portion of the crop must be cut days before it can be finished. We have known men who were called good farmers, leave their grass standing until August or September, unless it fell previously from over-ripeness or decay. The cattle who have to eat such hay do not relish it half as much as they will that cut the last of June, or during the hot week or two of July. They cannot see the reason for this.
