

"Safford Radiators"

The Composite Order

The Romans in seeking for greater richness in design combined with usefulness, adopted a mixture of the Corinthian and Ionic capitals. Like the Corinthian the capital is its principal distinction. This is of the same height as the Corinthian, and is formed by setting on the two lower rows of leaves of the Corinthian capital, the modern Ionic volutes, ovals, and abacus. The small space left of the bell is filled by caulicoles with flowers, and the upper of the volute is often flowered also.

The Safford Radiator

It is a combination of utility and of richness of design. It is the only perfect Radiator through which Hot Water and Steam Heat can be dispensed. The World has given it an envious recommendation. The "Safford" is made without bolts or packing or rods.
