

the flotation machinery. These ore-enrichment machines were built in Finland. They are smaller in scale than Soviet-built machines, but their productivity is almost double that of the domestically-made equipment. Test samples of the output of these flotation machines will be sent to the laboratory by pneumatic shuttle!

More than eight percent of the various units which will be used at the plant will be automated. In this connection the electricians and specialists in the installation of monitoring and measuring instruments and automation have an enormous amount of work ahead of them.

The construction workers have promised that the plant will be ready by the end of June. The fitters and tune-up experts are now finishing their work in the main building of the project. But they will still have a lot more work to do. They will have to lay dozens of kilometres of pipelines, to install the non-standard equipment, which still hasn't arrived, and to complete the water circulation system.
