

HUBER

Huber 20-40 Gas Tractor Flowing.

Whatever the extent of your farming operations, you have need of a mechanical power. The size tractor you need depends on the size of the farm, and whether you do threshing or other custom work with it. If you are operating on a big scale, you will not want anything smaller than our Thirty-Sixty. For lighter work, our Twenty-Forty or Fifteen-Thirty will suit.

As a medium size tractor, the Twenty-Forty is very popular. The illustration shows it pulling six 14-inch plows, turning the ground to a good depth, and doing it easily. It burns either gasoline or kerosene, and does not require a large amount of fuel for work. The Fifteen-Thirty is similar, but of lighter construction for lighter work. All sizes of Huber Tractors are equipped for both gasoline and kerosene.

Of interest to the thresherman, in connection with the matter of a power outfit, is a machine for threshing the grain. The HUBER grain thresher is

not and never has been excelled by any. It has a splendid reputation for saving and cleaning the grain. Farmers get full value from their crops when threshed with a HUBER. The Threshermen get full pay for their work, for all the grain goes into the measure. Oiling troubles are eliminated; for the HUBER has large automatic oiler which lubricates cylinder boxes without any attention from operator, except to see that oil pot is full at the beginning of each day. Belt troubles are avoided by automatic tighteners, which keep all belts at proper working tension, without stretching the life out of them or allowing them to slip on pulleys.

We furnish every modern attachment to increase the capacity of the threshing outfit and do it with the minimum of labor. We wish to get in touch with all who are interested in the operation of threshing machinery. We are able to make prompt shipment from stock, and furnish goods that will satisfy in every particular.
