Nature.

"Professor Tanner has put together in the form of a really readable story, a series of papers for the purpose of showing the manner in which the Science Classes under the Government Department enable a youth to prepare himself for the Government Scholarships, and by a tolerably complete course of science instruction qualify him for learning any industrial occupation with a thoroughly-intelligent mind. The story is both instructive and interesting, and we recommend it to all interested in technical education."

Agricultural Gazette.

"It is a capital picture of the five or six years of farm and college training which lie between the last of school-boy days and the settlement on a farm of one's own. Professor Tanner takes his hero through the village lectures, where he equips himself for a scholarship won at Rodney College, through which he passes with success, until after a year at the home farm in England, and a year on a Lothian farm, he finds himself prepared for the life of a tenant farmer. It is a very satisfactory little book."

The Liverpool Daily Post.

"Since Miss Martineau completed her tales illustrative of the principles of political economy we have not seen any so good exemplification of Præd's lines,

That many men will read a tale,
Who would not read a sermon,

as the little book by Professor H. Tanner now before us for review. He sketches in a lively and most entertaining manner the career of a young man who carries with him to his first tenancy, that of the Abbott's Farm, which gives its title to the book, a stock of agricultural knowledge . . . and of practical skill. . . . Nor can we refrain from saying that we entirely agree with the observations upon the education of farmers' wives, or rather of farmers' daughters, to fit them to be the wives of the farmers of the future. A few hundreds like John Holmes and (equally necessary) a few hundreds of Janets to match would be a gain to England, the value of which cannot be reckoned in money."

Preston Guardian.

"Few writers combine as Professor Tanner does a lively imagination and graphic power with solid science. He can enamour young people with science as applied to their destined means of living, if any man can."
