FARMER CONCRET "Hundreds of

Dollars In Actual Profit"

More than one farmer has told us—since he has got a copy of "What the Farmer Can Do With Concrete," that the advice it gave him netted him hundreds of dollars in actual profit.

Get the book—it's free—and by reading it you will see the profit there is in building improvements of CONCRETE according to its plain, simple directions. For instance, there's a page devoted to Watering Troughs—showing how to build the sanitary kind that will not rot, rust of leak. Several pages devoted to Concrete Silos, Others telling how to build concrete foundations for barrs. All these are improvements a farm needs—its value will go up considerably if you use concrete in the building of them. And you'll be able to "work" your farm with less effort and on a more profitable basis if your buildings and utilities are of the modern Concrete type. This book gives all the directions you'll need. directions you'll need.

Remember - Concrete improvements are fire-proof, rot-proof, vermin-proof and indestructible

The book also contains interesting photographs showing what other Canadian farmers have accomplished; with working plans revealing how they did it. Perhaps you are specially interested in some of the features listed in our coupon. Put a cross opposite the one shout which you want particular information.

Fibre Cheese Boxes

Ruddick, Dairy Commissioner. EVERAL thousand cheese were shipped last year in the new fibre boxes. In order to get accurate and unbiased reports us to the condition of these boxes on arrival in the United Kingdom I arranged with the Cheese Commission to notify my office at Ottawa when cheese in fibre boxes were included in any shir ment and the cargo inspectors employed un der my direction at ports in the United Kingdom were instructed to be on the lookout for them and to make special reports as to their condition, and to obtain the views of the trade regarding them. These reports do not indicate that this package is a perfect one as manufactured at pre-sent. The covers are frequently torn loose and there is a tendency for the fibre to soften slightly, pre-sumably by absorbing moisture from the cheese. When this occurs the box is liable to be crushed when it has to stand the weight of a pile of five or six boxes.

or six boxes.

Quite a percentage of the boxes
were reported as torn with the hooks
used in handling. They will not
stand that sort of usage. The patent
cheese truck as used for wooden
boxes also breaks or tears the fibre
band, but this can be, and has been
the some warehouser remedied by an in some warehouses, remedied by an alteration in the truck which prevents the tearing. As I have already said the fibre box is probably not a per fect box, but I think it is capable of improvement, and even at present it would appear as though it arrives in as good condition, if not better, on the average, than the ordinary wood

I am rather hopeful that the fibre to an rather nopetul that the fibra box, possibly with some improve-ments, will solve the box problem of the future, providing the cheese are all made of one diameter. In many cases the fibre boxes were too large or the cheese and the percentage of damaged boxes was much greater in such cases. This lack of management which results in cheese being shipped from the factories in boxes which are either too large in diameter or too low for the cheese, is inexcus-able and it is coming to be recognized every day as a more serious defect. It is considered sufficient cause to re duce the grade of the cheese onc.
When there is a loss of one-half a
cent a pound, or 43 cents per box, on
account of these defects—that is badly fitting boxes in one respect or another—surely it is time to provide a owner surely it is time to provide a remedy. If a cheesemaker has the ordering of the boxes it would be a much more reasonable thing the charge him with any loss arising out of such a defect than it is to charge him for inferior quality in the cheese itself.
