The patient made an uneventful recovery from the operation, but for three years after, when she again sought medical advice, the pain continued as before, with the addition of slight swelling and tension in the right hypocondriac region. The patient passed through the artificial menopause with very little inconvenience or nervous disturbance.

Case 2.—Man, married, age about 27, suffering from acute attack of appendicitis, as diagnosed by the attending physician, two consulting physicians concurring. Constitutional symptoms present and anatomical appearances, such as tension, redness, swelling and pain at McBurney's point, pronounced. Operation advised, to which patient and wife objected.

In both the above cases Antiphlogistine was repeatedly applied, with the most marked benefit. In case one, although the woman had suffered three years after the operation, through the influence of Antiphlogistine, the pain and tension were modified, leaving only a small, soft elevation in the region of the appendix. Pain returned only at long intervals and with diminishing severity, and there is every indication now, after one year's treatment along this line, of permanent relief.

In case two the same treatment was carried out. Tension, redness, swelling and pain diminished with the first application of Antiphlogistine, and disappeared after ten days. With some constitutional treatment the patient entirely recovered in this time. In this case there has been no
