containers were considered more desirable. Strippackaging would appear to offer the maximum protection against the accidental ingestion of a large number of tablets by children. Manufacturers should be urged to package ASA products in this manner.

"Child-proof" safety closures should be used on all retail packages of ASA. Ordinary screw caps or currently used snap caps are not considered to be suitable child proof closures.

A cautionary statement should be part of every piece of ASA advertising – printed, visual and audio – warning of the potential danger to children, and pointing out the needs for safe storage and adult supervision of administering the drug.

FOREST-FIRE "HOT-SPOTTERS"

by the Ontario Department of Lands and Forests for the past two years, will undergo further field tests this year before being put into general use.

"Hot spotters", portable fire-detectors for the locating of small hidden fires, are based on the fact that all surfaces radiate infra-red energy, which increases with surface heat. The units focus infra-red energy on a sensitive cell that generates a small current, and, through electronic amplification, provides an audible signal. This signal becomes louder as the temperature rises.

The unit, which has a working range of up to 300 feet, weighs only two pounds and looks something like a gun. It is easily operated because it has only a volume and threshold controls.

Lands and Forests' forest protection officers predict that the new equipment will play a significant role in the patrol and mop-up stages of forest-fire control. Designed to locate deep-seated fires on a fire perimeter — pinpointing problem areas so that appropriate action can be taken — the "hot spotter" should eliminate many hours of patrol duty now necessary to control forest fires.
