General Intelligence.

Insects as Pollen-Transporters.

The pines and other conifers, the grasses, and sedges, and the forest-trees, for the most part depend upon the wind to waft the pollen of one blossom to the pistil of the next.

These insects are very numerous, and are of many kinds, but the most common are the bees, the flies, the butterflies, and the beetles.

These insects are very numerous, and are of many kinds, but the most common are the bees, the flies, the butterflies, and the beetles.

The Fixed Stars.

The first impression in looking upon the sky on a clear night is that the stars are countless; but it will be found that, bringing the eye to bear on a particular part of the heavens, the stars can be counted. There are about 6,000 stars visible to the naked eye. With a little opera-glass, 300,000 stars can be counted, and with the largest telescope it is found that the number of stars is about equal to the population of the United States. About 600,000 stars have been catalogued, and their positions fixed. It is found that the stars differ in brilliancy. This is because some are larger than others. There are twenty stars in one first magnitude, thirty-five of the second, 140 of the third, 327 of the fourth, 960 of the fifth, 4,400 of the sixth, and about 14,000 of the seventh. It is also found that many of the stars change in brightness. Indeed, there are very few that do not. Some of the stars are young and growing brighter, others are old and growing dimmer. It is found that the sun and its planets are moving toward a certain point in the universe. The stars are separating ahead of us, and closing up behind us.—Prof. Young.

The New I. C. R. Office.

(Continued from Monday Papers.)

The large imposing building nearly completed in Montreal for the General Offices of the Intercolonial Railway will certainly prove an ornament to the town. It is fitted with every modern convenience, and when fully completed will contain the finest railway offices in Canada. The total cost will be about \$75,000.

The building is a parallelogram 115 feet long by 75 feet wide, with a projection at each end of 114 feet by 35 feet, and is three stories high above the basement. The basement is 34 feet high, the two main floors each 15 feet high, and the attic story is 12 feet high. The main entrance is from the Main street, through an arched stone porch, leading into a tiled vestibule 114 feet square and a hall 112 feet wide, running across the building to the entrance from the railway, which is reached by a tiled vestibule 112 feet by 6 feet. The staircase, easy of ascent, leads from this hall to the upper floor. A corridor 9 feet wide runs from the vestibule through the centre of the building, on every floor.

The edifice is constructed of brick, faced with pressed brick, and the basement, columns, windows, doors, etc., are of red granite. The walls of the basement are built of squared blocks of freestone. In the centre of the building, on the north side, is a large square room, 112 feet by 1
