

Note:—This discharge curve has been altered slightly to conform with the more complete data obtained during the spring of 1907 and 1908.

The measurements taken in 1907 made the original curve appear to give too small discharge from elevation 131 upwards, hence Note No. 2 was added to the daily discharge plates.

However since the printing of the above plates the river rose to a level not reached since the year 1899; in extending the curve to intersect the gaugings made at this higher level it was found to conform more closely to the original plotting, a slight variation occurring between elevations 130 and 138.
