attained and crosscuts driven to the walls. Location-This property is situated on Judging from present indications this Nigger mountain, about two miles northwill be found to be a replacement vein west of the valuable Velvet, Portland trending at 72 west and 72 east, intersectand Victory-Triumph mines on S phie ing the formation and standing nearly mountain, and one mile north of the vertical, having only a slight dip to the promising property, Big Four, on Santa Rosa mountain. It is situated close to southwest. The matrix consists of gran-ultic gangue matter, thinly, disseminated Melville townsite, and Big Sheep creek with chalcopyrites, blende, iron sulph des passes close by the eastern side line, and galena. while the west fork of Big Sheep creek runs nearly parallel with the south end Development-An open cut has been line, and only a few hundred feet from

made about eight feet wide and three feet deep, from which small values can be obtained similar to the surface assays where the shaft is sunk. This opening shows similar vein matter. A staft seven feet by five feet is sunk

on the vein matter to a depth of 10 feet, and shows 30 inches of shipping ore at that level. When I first visited the propcentrating plant will be required, and in that case the ore dressing mill will be situated on Sheep creek and run by water

power. Road-A wagon road is already in construction to the Velvet mine, and C. P. R. officials are surveying a railroad into that district, but these are of little use to the Evening mine. A good road can be cheaply built from the town of Melvil e, and on a slight down grade to a point on the Red Mountain railway about five miles from Northport. A sleigh road should be made over this proposed route as soon as possible so that the ore can be shipped and profits made in development. Supplies-The usual rate of the dis-

t ict but present means of transportation from Rossland adds greatly to the cost. They should all be brought in over the new road, which will effect a tremendous saving.

Gold. Silver. Copper. Lead. Zinc.

Profits—A shaft seven feet in length with two and one-half feet of shipping ore, and allowing five cubic feet per ton, would return 21 tons of ore for each fathom in sinking. An ore of this class would be worth as follows mix would be worth as follows, viz:

11.73 oz. silver at 59c. per oz., 95 per cent paid for, \$6.58. 53 per cent lead at \$4 30 per 100 lbs., 90 per cent paid for, \$41.50. 10.4 per cent zinc with 60 per cent ore

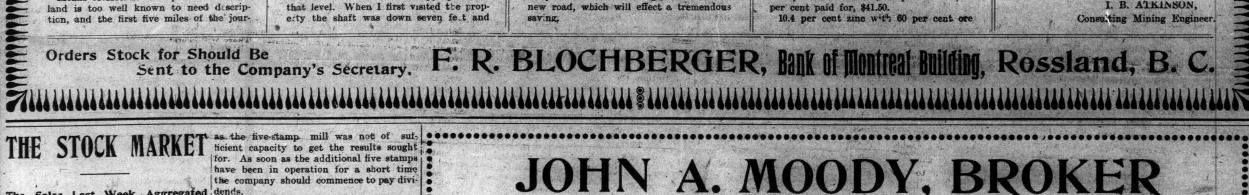

5

Freight and smelting 21 tons at \$18.50

Net profit per ton of ore raised, \$12.70 Improvements.-A nice comfortable cabin suitable for six men has been put up close to the creek, a large shaft house has been erected over the well-timbered shaft about 300 feet distant from the

blacksmith shop. Opinion.—The property is located in a good mineral country, and the various mines referred to in this report are in a position to ship ore as soon as bet.er transportation is provided. On my sec-ond inspection the mine showed immense improvement, and every indication of the shipping ore increasing in width, so that with careful and capable management this should be a good paying proposition. In this early stage of development it can only be classed as an exceedingly promising prospect which will pay from the start and well worth consideration and inspection by speculators.

Yours faithfully, I. B. ATKINSON,

e of Captain inted to "C" now in the ent, and Cape made va artillery. WOOD.
