

We should thus have the Quebec group divisible into three natural and well-marked parts:

3. The Quebec or upper division;
2. The Lévis or middle division;
1. The Sillery or lower division,

just as we find the Trenton group divisible also into series of terranes; and these divisions are all marked by peculiar and distinct faunas, each of which is characterized by fossils to be given in the table hereto appended.

The Trenton group characterizes the upper portion of the Cambro-Silurian or Ordovician system; the Quebec group characterizes a portion and peculiar development of the Cambro-Silurian or Ordovician.
