

FOUR POCKET GRINDERS

Is your grinder capacity sufficient to absorb all the extra power developed in the spring of the year?

If not, why not convert your existing three pocket grinders into four pocket grinders and take advantage of the extra power?

As can be seen by the photograph above, the Waterous Four Pocket Grinder is of the same sturdy and

efficient construction as the three pocket type.

It is designed so that it can be set on the base plate of the existing three pocket grinders, so that all that is necessary to convert three pocket grinders into four pocket machines is the purchase of the extra pocket with intermediate head and hydraulic cylinder, two top frames.
