As economy in the accumulation and application of manures is a subject of almost paramount importance to the farmer, we offer a few remarks on the subject. In the first place, the dimensions of the barn-yard should be adapted to the amount of stock to be wintered. The barn being sufficiently capacious, all the products of the farm should be housed—the farmer can then consult his interest, either to thresh his grain in the fall or winter; but supposing a part at least to be threshed in the fall, the overplus of straw after littering the yard to the depth of a few feet, should be nicely stacked—this littering lays the foundation for the absorption of all liquids consequent upon the
