

Arbor Vitæ and Junipers, the interspaces being filled with bedding plants in summer. This method of planting possesses many advantages, since it makes the beds attractive at all seasons of the year. In some of the beds in prominent places *Azalea amana* is much used; here it grows to be a shrub of considerable size, and is perfectly hardy; its fine masses of brilliant flowers are said to be particularly attractive in spring. There are also large masses of *Rhododendrons* grouped in some portions of the ground, which must present a magnificent spectacle during that portion of the summer when they are in bloom.

In all departments an immense amount of work has been done during the last two years, and at the time of my visit planting and transplanting were proceeding most vigorously.

SAUNDERS' HYBRID RASPBERRIES.

BY CHARLES ARNOLD, PARIS.

When discussing the question of "What varieties of Raspberries are succeeding well?" at our summer meeting in St. Catharines, I find, on page 29 of our last year's Report, I am represented as saying "The Saunders' Raspberry has given very poor satisfaction." This, Mr. Editor, is a great mistake. Substituting the word *good* for the word "*poor*" in the Report, might make it correct. I certainly could not have said anything bad about them last year, for when growing by the side of Mammoth Cluster, Philadelphia, Clarke, and several other old varieties, several of Saunders' Hybrids were more productive and better flavored than Philadelphia, and certainly equally as hardy as any variety grown.

We regret the error mentioned above should have appeared in our report of the discussions. It arose from a misunderstanding of Mr. Arnold's remarks, and we distinctly remember the feeling of disappointment experienced by us at what we supposed him to have said, and it is very gratifying to learn that these new hybrids which possess so many points of interest are likely to prove valuable sorts.
