(continued ream page 184.) and melted together: When thorough-ly melted the liquid is poured into cold water. It is then pulled until it becomes tough and is about the color of molassee candy. This mixture may be applied as wax, paint, or on band-area ages

ages. Wax bandages are made by coating cloth with hot wax. When dry and there-quarters of an inch wide. Begin at bottom and firmly wind it around the graft, seeing that it fits tightly a After crowth storts in soring. it is

in all places. After growth starts in spring, it is important to rub off the stock any suckers or water sprouts that are likely to choke out the scions.—A. B. Cutting, O.A.C., Guelph.

### LAME HORSES

r. A. has a mare that has been I. A. has a mare that has been lame in the front foot or shoulder for over a year. Cannot see any blem-ishes or swelling. She flinches when pressing the muscles of the shoulder.

2. B. has one afflicted the same way only in the hind leg. He drags his toe some in walking. What would be good to apply?-D. M., Queen's Co., N.B. 2. B. has one afflicted the same

1. Observe lamenesses in the fore extremities are more apt to be in the foot. Being lame for over a year would lead one to believe that structural changes, probably navicular in character, may be the cause of the character, may be the cause of the trouble, though it is hard to say from the symptoms given. In the early stages of troubles of this kind, caused stages of troubles of this kind, caused usually by a severe sprain of the ten-don, severe bruise of the frog or heel, etc., paring the foot well, reducing the frog a little and putting on a wide-webbed, open show with the heels raised half an inch to take off the bearing from the heels and frog, and to relieve the tension on the tendon, to relieve the tension on the tendom, putting the foot in a hot, soft, lin-seed poultice, for a couple of weeks, changing once a day and turning the horse to pasture lor a time might help some but we question whether it would be worth while trying this at this late stage. An examination who could locate definitely the trouble, would, we think, be more satisfactory than any advice we could give at this late day. 2. The majorgive at this late day. 2. The major-ity of obscure lamenesses in the hind lty of obscure lamenesses in the mind leg are usually to be found in the hock. If in this case the horse has been lame for a year, we would also advise you to consult a veterinary surgeon. If fuller particulars were at hand, more definite advice might be given.

#### SETTING OUT AN ORCHARD

What do you think of setting out an apple orchard hexagonal, and what distance apart? Would you advise planting one, two or three year-old trees? Is spring or fall the best for planting an orchard in a mild climate like we have here --C. E. W., Verson, B.C.

## Ottawa, March 24, 1903.

Ottawa, March 34, 1903. The chiel advantage of planting apple trees after the hexagonal sys-tem is that there is a little aaving of ground. If land is not scarce the rec-tangular system is as good as any. Apple trees are likely to reach a large size at Vernon, and I would advise planting the trees 32 or 33 feet apart each way. I deemed advisable, early planted between but unleas the or-chard is to receive very careful atten-tion, the temporary trees may not be ett out in time and the whole plant-tion would suffer. Spring should be
