knows the great necessity for and the value of operations for the removal of tonsis or adenoid enlargements in children, quite as well as he knows that such operations are too often ill-such operations as school teachers and nurses are permitted to advise parents who are presumed to be too poor or too ignorant to have medical advice, that Johnny or Mary should have tonsils or adenoids removed. No school teacher and no nurse is qualified to give such advice. The opinion of a school teacher or a nurse that a child has adenoids is absolutely worthless and should never be taken seriously by any parent. There is no outward sign, appearance or expression characteristic of the presence of thickened adenoid tissue, notwithstanding an opposing fancy which has been urged upon teachers and nurses who are expected to play the role of amateur dector. Mouth breathing, thick nasal tone of voice, fauity palate, dental and face development, mental backwardness (from impaired hearing), and the like, are by no means sufficient to warrant a diagnosis of deenoids. There is but one way in which an accurate diagnosis of the presence of an abnormally large or thickened adenoid body in the post-nasal region may be determined, and that is by feeling it with palate, and the post-nasal region may be determined, and that is by feeling it with palate, and the post-nasal region may be determined, and that is by feeling it with palate and the fact that in a caspondul of the trough the feet?
