
Water Powers of Canada

they are at or near navigable water. Grand Falls is at the head of navigation on the St. John River, while the other sites mentioned are close to excellent ocean harbours, such as at Liverpool, Sheet Harbour and Minas Basin.

The Maritime Provinces are particularly rich in timber and minerals, such as iron, gold and coal, and it would seem that some of the larger sites could be very profitably developed in connection with large industries founded on these natural products. It is probable that in the near future, electrical energy will play a large part in the reduction of various iron ores and the manufacture of certain kinds of steel.

A number of smaller sites in Nova Scotia are so situated as to be of great service in connection with gold mining. Already some development along this line has been done

Fish Ladder, Lower Pulp Mill Dam, Mersey River, Nova Scotia.
