

Elevator Facts

Last month we mentioned the fact that elevator designs keep changing and improvements are constantly being made. We well remember the first electric elevator made in Canada, and the proud feelings of the makers at that time, but it certainly was, in comparison to present day elevators, a crude affair—it worked however, but it did not work well. Just like some present day airships, it came down with a bump sometimes. Sometimes it would not go up, to come down, and naturally there was trouble. The electrical apparatus, like the elevator it operated, was imperfect, and at times would give a firework demonstration worthy of a grand stand performance, but through constant effort and expensive experiments a result has been obtained which now puts electric elevators in a class of mechanism as nearly perfection as possible. We have men who are paid well to improve and simplify our elevators, and to-day we have the most simple and up-to-date elevator machine made. We have less complicated working parts than on any elevator made. Our machines are the essence of simplicity. We make all types of electric, hydraulic, belted, hand power, elevators and dumb waiters. We install from Coast to Coast, and have resident representatives in every city. Our price like our machines are not complicated, and are easily taken care of. Our business doubled last year, and there's a mighty good reason why. Let us give you our prices, perhaps you will be able when you get them to put an elevator in your building, but had hesitated on account of some elevator quotations you had received. Personal attention is given to your enquiries, large or small. Our letter in reply to your enquiries will be signed by Parkin.

The Parkin Elevator Co., Limited
