☾ The column of the moon's southing gives the time of high water at Parrsboro', Cornwallis, Horton, Hantsport, Windsor, Newport, Truro, &c.

AUTUMN TRANSPLANTING.—Apple trees are very hardy, and generally succeed best if set out in Autumn, as the soil becomes well settled about them, and they have nothing to do early in the Spring but to commence growing. In this way they get an earlier start. If the roots of a Fall transplanted apple tree are examined in Spring about the usual time for digging trees, a new set of rootlets will be found pushing out from the old ones, at least a week or two in advance of any that may be emitted by Spring set trees. If, however, they are dug in the fall and well laid in, the same rootlets will be formed early in spring, and such trees, if set out carefully so as not to injure these, will possess a decided advantage over such as are dug in spring. Cherry and pear trees are nearly as hardy as the apple, and may be advantageously removed in autumn, if the precautions pointed out are observed. It is absolutely necessary in all cases, and with all sorts of trees, to secure them from being blown about by the wind.
