

- |                                      |  |
|--------------------------------------|--|
| 1. Stature.                          | 9. Length of head.                       |
| 2. Finger-reach.                     | 10. Width of head.                       |
| 3. Height of ear.                    | 11. Jugal width of face.                 |
| 4. Height of 7th vertebra.           | 12. Distance from root of nose to chin.  |
| 5. Height of acromion.               | 13. Distance from root of nose to mouth. |
| 6. Height of point of second finger. | 14. Height of nose.                      |
| 7. Width between acromia.            | 15. Width of nose.                       |
| 8. Height when sitting.              |  |

In discussing the series, I have excluded all males of less than 20 and more than 50 years of age, and all females of less than 19 and more than 50 years of age, the former because they have not reached the adult stage; the latter on account of the incipient changes incident to old age. It may seem that the lower limits are fixed too low, but, as the growth after 19, viz., 20 years, is very slight, the gain in accuracy resulting from the average of a greater number of individuals far outweighs the slight error that is introduced by the immaturity of a certain number of them.

On examining the series, it appears that there are very marked differences between the various local groups. In order to make these differences apparent, a table of those measurements which vary most among the different groups is here presented. In addition to the average, the table contains the limits between which one-half of the series is found—*i. e.*, the probable variation. The last three figures in each column are the finger-reach, height when sitting, and length of arm, expressed in permills of the stature.
