to \$127,490 on the larger and \$129,time ago an announcement of the those which were imperative from 490 on the smaller project. the standpoint of economic development, those which were highly desirable but did not have to be undertaken at once, and those which had economic merit but could be shelved indefinitely. Chignecto

was placed in the first group. Early in 1875 "the Daily Telegraph" of Saint John carried a plan put forward by a civil engineer, H- G. C. Ketchum who was born in Fredericton, to build a ship rail-way across the isthmus. For sevway across the isthmus. For several years this plan was given considerable attention. In 1881 Mr. and make it recession that the necessity to enter and leave a finished product. Certainly there is an opportunity for development and make it recession to the in the contract of the product. Ketchum made a survey at his own expense and submitted his plans to the Dominion Parliament, seeking financial assistance. At the same time he undertook to form a company and to furnish private capital. Parliament passed a bill granting a subsidy of \$15,000 a year for 25 years, and a company was formed in London to carry out the project. Work began in 1888 and continued until July, 1891 when, owing to the failure of Baring Brothers in London, no more funds could be obtained. Three-fourths of the work was finished and another year would likely have seen the enter-prise ready for operation. But failure of the company to raise money and the refusal of the Dominion Government to contribute led to the collapse of the whole project. Now only silted up terminal docks dismantled buildings and the rightof way across the isthmus remain. The railway was 17 miles long, extending from the mouth of the Musaquash to Tignish on Baie Verte. Vessels were to be admitted to the docks placed on cradles lowered into the water. Then they would be hoisted by hydraulic power, and placed on railway trucks to be hauled to the other terminal.

navagate. This raised the question of water lockage purposes. The
commission found there was a deficiency of water along the route
declared by the engineers as most
declared by the engineers as most
time highway it would not likely
necessary to build a numning plant, be attractive to shipping consider.

Incomparize through proper forest
conservation and extended utilization of forest products; through
the introduction of additional secondary industries, where the development of such industry is econvelopment of such industry is econdeclared by the engineers as most matched by the engineers as most at the Baie Verte end since the water of the Bay of Fundy could not be used because of the silt which it contained. In the absence of hyproduct of modern canal construction, steam would have to be used to operate the pumping plant. The canal would necessarily be a full-tide project because of the loss of time caused by awaiting entrance to a half-tide canal.

For coastal services and the smaller type of ocean going vessels a canal would have to be 18 feet deep, have a bottom width of 70 to the contained by industries. As a through matched the would not likely the highway it would not likely the highway it would not likely the the deshipping, consider-to shipping, consider-to shipping attractive to shipping possible navigation conditions in more open waters.

There is no possibility of developing to such shipping possible as tractive to shipping considers and stractive to shipping co

It is unnecessary to emphasize feet, and a lock 48 feet wide and the arguments advanced for the 200 feet long, and in 1931 would construction of a canal across the have cost \$23,045.00. A somewhat dustrial development, agricultural one-half of one percent, maintenstressed along with many other smaller project and \$2,762,400 on

and make it necessary to be aground at dock between tides.

However a full-tide canal at Chignecto would not meet these difficulation.

However a full-tide canal at Chignecto would not meet these difficulation. However a full-tide canal at Chignecto would not meet these difficulties as far as the canal interval was concerned. The upper waters as means of improving adds up to \$9.50. The three formals at say \$1.00 a couple, the see this campaign a big success.

Not Economically Feasible

The most recent complete report on the proposed canal is that of the Chignecto Canal Commission of 1931, of which Arthur Surveyor was chairman. This Commission was assisted by the Department of Railways and Canals. Since the report has been given very little publicity in recent months it is wise to consider it in some detail.

The St. Lawrence Waterway
Another important fact brought forward by this Commission was in answer to those who advocate construction of the canal because of Canada's great outlay and annual charge for canals, very little of it in the Maritime Provinces.

There is no alternative to the St. Lawrence waterway. The Welland and the Sault Ste. Marie Canals are part of the only navigation route The St. Lawrence Waterway

alone along the Missiguash route, plus the total cost of a tidal power project. There would be no economy in combining a navigation and power project. But subject to the approval of the Dominion, which exercises jurisdiction in tidal waters, and subject also to the safeguarding of navigation rights, it would be possible to proceed with a tidal power project independently of the canal, should the development of tidal power on a commercial scale become a prpactical proposition for the provinces concerned, or for private industry.

Iron Ore Concessions Bay does have unusually strong tides but these should present no great difficulty. The tidal conditions present difficulties such as kets or transportation costs for the

of the Bay of Fundy are not likely our employment situation. The to prove attractive as an ocean liner route.

The report of the 1951 Commission points out to those who stress shorter distances by sea as an argument for the canal, that distance alone is not an absolute criterion.

The time consumed in navigation is of equal importance. It is only when time of navigation is reduced to terms of equivelent distances that a correct estimate of relative advantages is possible. The necessity of approaching carefully and to prove attractive as an ocean project would provide work for a sity of approaching carefully and ergency work projects to ease un- by the monopolies and by national sity of approaching carefully and traversing a canal with locks and a restricted channel consumes time which could be utilized on the sea by sailing full steam ahead. Considering this in certain cases the sidering this in certain cases the constraint of the sea of make-work projects. The care for such a policy can be sidering this in certain cases the constraint of the monopolies and by lateral more profitably statutated by the monopolies and by the monopoli sidering this in certain cases the ranal would offer little advantage, in some none whatever in point of crease the capital assets of the capital assets of the capital assets of the common whatever in point of crease the capital assets of the time. However to reach northern
United States ports from Prince
Edward Island and mainland ports
adjacent to the canal there is an
advantage in both time and discommendation—"It is recommendcommendation—"It is rec ed that the Provincial Government request the Dominion Government

The report of the House of Com- utilization. publicity in recent months it is wise to consider it in some detail.

The 1931 Commission found the project feasible physically, but not economically. A canal with locks would have to be built, since the unusual tidal conditions at Chignecto would set up a current of scouring velocity and make an ordinary run of water canal impossible to navagate. This raised the quest-

STUDENT FORUM
