Hay is one of the most important crops, whether as regards market
home consumption. The comparison of cattle fed upon hay properly made
stating that and improving in appearance and where the hay
improperly cured, absolutely appearing to starve when withdrawn from
the pasture, would be enough to prove to any one that the more care
closed upon this crop the better in every respect. The quality of the hay
depends on the herbage of which it is composed, on the stage in which it is
cut, and on the process of making.
To produce rich and productive pastures, we must anticipate nature
thoroughly stock the land with a good variety of the best grasses, and
as are palatable and nutritious; that resist drought and grow at low
prices, that are large growers, and spring quickly after being cropped.
