## THE CULTIVATOR.

[^0]
## MONTHLY CALENDAR.

Tris is really a joyous month for the husbandman : his crops now begin in earnest to improve, and his stock are no longer confined to the farm-yard. Spring Wheat, oats, peas, and cullivated grasses wust first be sown; and then follows, in succession, the sowing of barlicy, the planting of potatoes, and the drilling of turnip and other root-crops. The whole of these departments of labour will ve fully completed by the intelligent cultivator at or near the close of the present month. Carry out dung from your compost beap, if you have previously made one, and apply it to your meadow grounds: top dress also with gjpsum of charcoal-dust $;$ einher of these substances have great altraction of moisture from the atmonphere, thus cooling the air in ummer, and also being more efficacious to dry sindy soils than cold wet clays.

To corroborate the ruth of this statement, it is worthy of remark, that the dew has he a known to stand two hours later in the morning upon clover and other plants which had gypsum spread upon them, than upon others, on which there was none. If you have never made an experiment with dressing your land with marl, now is the tume: try only a few square rods : any crop will be benefitted by its application, and its effects will be apparent in the soil for eight or nine years. Lucerne, vetches, and rave may be sown the latter part of this month, for soiling : the soil forthese crops require to bo deep, rich, and wellworked: ashes and gypsum are the best dressings for these crops: if our readers have not been in the habit of growing these crops, for soiling and fur feeding sheop, it is worth the troubie to give them a trial, although it be but on a small scale.
At the cluse of the month, commence sowing Sweede turnips, mangel quizel, and carrots, for the winter feeding of stock. A small faimer, who has only ifify acres undes cutivation, ought to culuvate, in a proper manner, an acre of each of these roots, and four acres of polatoss, fur the winter feeding of slock; and those who have larger farms in that proportion. Afler the rout-crops
are gathered and housed, the ground should be seasonably prepared, and sown with spring wheat, and laid down with culivated grasses. Root-crops are generally planted or sown too late in this country: the early sown produce the most certain and heaviest crops; and the larger the ruots the better for feed, as regards nutriment: the ripest roots, in all cases, contain the most sacharioo matter. By early sowing, the young plant has fewer insect enemies to encounter ; and, in case of failure, time is given fur anothor suwing.

## WESTERN DISTRICT PHILOSO. FIIICAL AND AGRICULTURAL ASSOCLATION.

We have read, with considerable interest, the proceedings of the above Institution, ns contained in a late number of the Western Express. The plan of organizing Township, District, and Provacial Societies is highly approved or; and it appears that a correspondence has been ontered into with the different Councillors, and other infiuential individuals, on the sulject, to ascertain how far it would be practicable to carry the same into effect. We understand that the President, Miajor R. Lachlam, J.D., intends publishing a synoptical view of
