

Is Your Baby a Glaxo-Baby?

This bonnie little boy only weighed 5½ pounds at birth, and until two months old made but little progress. On the strong recommendation of the nurse he was put on Glaxo, and in a letter to us his mother says: "Then his improvement was wonderful. At five months old he weighed 20 pounds. He is now just under 2½ years and cut all his teeth without any trouble. He is a very big, healthy boy. My doctor thoroughly approved of Glaxo."

DURING the Hot Weather, when so many Babies are sick from the mere fact that they are unable to digest their food properly, **your baby** may be perfectly well, and may be able to go through the whole of the summer without any trouble whatever, provided that the food you are using is suitable.

If you are unable to nurse Baby yourself use Glaxo, because Glaxo so closely resembles Mother's Milk that Baby can go from one to the other without knowing the difference.

Nature designed Mother's Milk specially for Baby, and Glaxo is designed to exactly fill Nature's requirements. It is impossible for you to improve upon Nature, but Glaxo is the closest possible approach to Mother's Milk, being entirely composed of the solids of the purest tested milk and cream, scientifically sterilized, the indigestible solids of the milk being broken up by the wonderful Glaxo process, and thus rendered easy of digestion by Baby's delicate digestive organs.

Provided that your Baby can digest its food properly during the whole Summer you will have no trouble with Summer Complaint. At **no time** should risks be run with starchy and unsuitable foods, and **particularly at this season of the year**. No starch, flour, cereals, artificial sugar or preservatives exist either in Mother's Milk or in Glaxo.

Strong babies fed on Glaxo **KEEP STRONG**, weak babies fed on Glaxo soon become so big and strong and healthy that they are not recognized as the same babies. **THAT IS WHY YOU SHOULD USE GLAXO!**
