DIRECTIONS to FARMERS and GARDENERS. A S fome Springs are much earlier than others, the following Directions ought not to be too literally adhered to in point of time; but may rather ferve to point out the order in which things may fucceed each other; but as to the precife time of beginning; the judgment of the planter muft be in fome measure regulated by the appearance of the furing.

The last week in April, fow early peafe, cabbage, parfnips, parfley, onions, turnips, radishes lettice and mustard

However, those mentioned for the last week in April, may be put in whenever the frow is gone, the frost out of the ground, and the earth fo dry as not to be muddy, and the others fucceed in their order.

The first week in May, few oats, wheat and rye, also fome early English beans, (and the main crop by the 10th of 12th) spinage and orrice; and by the 20th of May a few hills of cucumbers, and a few early buth beans.

The middle of May, fow hemp and flax, and any time between this and the roth of June will do for potatoes, fuch as are planted about the first of June, are frequently the largest but the satisfit planted are as commonly the best to eat, being drier, in confequence of their being more thoroughly ripe.

The first week in June, plant all forts of kidney beans; also cucumbers, squashes and pumpkins

The 20th of June, fow buckwheat ; this is alfo a good time to fow in herds-grafs; clover, or any other fort of grafs feed, which is thought to fucceed better if fowed now with buckwheat, than in the fpring with bats. Herds grafs that is fowed the latter part of June or through the whole of July, inftead of running up, heading out, and ripening as that does which is earlier fown, fpends the fummer in foreading into a large bunch, and rooting firmly, by which it not only bears the feverity of the winter, but fends up from each feed many more stalks the enfuing fummer. The farmer fhould be careful to fow his clover, if poffible, before the end of July ; for it is very apt to be killed with the winter, if not well rooted, and it often happens that crops which come up well, late in the fall, are wholly killed, fo that a fingle plant cannot be found the next fommer .----- The first week in July fow field turnips--- the early Dutch may be fown as late as the 25th. --- The 20th is a good time to fow turnip radifh, and for a late crop, fome falmon, ditto, as late as August 10th .---- About the middle of August is the beit time to fow winter wheat and rye, as by being fowed early it will be better rooted to fand the feverity of the winter, and be more likely to efcape a blaft by coming in earlier next fummer. In the fore part of September, corn fallad, which may then be cut any time in the winter or foring when the fnow is off.
