- Full Moon, 27th " at 8 " 27 " afternoon. S. E.

ASTRONOMY FOR THE MONTH.

During this month the constellation Taurus is a conspicuous object in the Heavens. It contains 141 visible stars, including two remarkable clusters called the Pleiades and Hyades. The brightest star in the former of these well-known groups is Alcyone, which of late years has excited more than ordinary interest, on account of the researches of Mädler into the proper motions of the stars of our firmament, leading him to decide upon it as the centre round which all the others revolved. Aldebaran shines conspicuous among the Hyades, and belongs to the class of double stars. On the first of the month, he crosses the meridian at 9h. 42m. P. M., at an altitude of 62°.
