

(Fig. 2.)

Fig. 2.—A group of epidermal cells with endocytosomes, *end*, *n*, the nucleus. In one cell there are several endocytosomes (*end'*) present within the same membrane. $\times 500$.

As these structures and analogous intracellular forms in epitheliomata are likely to be the subject of a great deal of interest in the near future; and moreover, as the views of Darier and Wickham, as to their nature, may not be endorsed by all pathologists, it is convenient to have a name for them which will express no preference for any particular theory. I have, therefore, selected the term *endocyte*,* which is both readily applicable and intelligible, and it will, I hope, serve the purpose until the question

**Endon* within, and *kutos* a vesicle or cell.
