INSTINCT OF SPIDERS.—A small spider (*Epeira Diadema Latreill*) had spread its net between two neighbouring trees, at the height of about nine feet. The three principal points to which the supporting threads were attached, formed here, as they usually do, an equilateral triangle. One thread was attached above to each of the trees, and the web hung from the middle of it. To procure a third point of attachment, the spider had suspended a small stone to one end of a thread; and the stone being heavier than the spider itself, served in place of the lower fixed point, and held the web extended. The little pebble was five feet from the earth. The whole was observed, and is described by Professor Weber of Leipsig.
