Plague of 'superbunnies'

(ZNS) — And you thought "The Creature that Ate New York" was just a movie.

The British Magazine Undercurrents reports that giant rabbits

are plaguing the British nuclear industry. These dreaded creatures — immune to poison, as big as hares, and bold as brass — are running amok at British Nuclear Fuels Ltd's Capenhurst enrichment plant and at the adjacent electricity council research center.

The superbunnies are munching on the grass at the disposal site and seem to be thriving on it, the magazine says. "The only way of getting rid of them is to get in a rifle-toting assassin to carry out a cull every year or two.'

First nuclear reactor

SASKATOON (CUP) — The Saskatchewan government has moved another step closer to aquiring the province's first nuclear reactor, according to the University of Saskatchewan student newspaper the

Sheaf.

The Atomic Energy Control Board (AECB) has given approval to a reactor location at the northern end of the University of Saskachewan campus.

However, the final licence to operate the reactor is still pending approval according to W.H. Husband, an official of the Saskatchewan Research Council (SRC).

One of the purposes of the reactor, according to the SRC, will be

to detect radioactivity in uranium ore samples on a commercial basis.

The first "client" for the reactor will be the Cluff Lake Mining Company, which is 80 percent owned by the giant European multinational AMOK and 20 percent owned by the Saskatchewan government. The company is currently mining uranium on a large scale in Northern Saskatchewan and workers there have recently accused the mining operators of running roughshod over health and

Before the reactor can be installed the SRC says it must conform to certain restrictions-one of which is strict security plans. Most times, the reactor will be under AECL supervision, but when it is not, the U of S security office will monitor radiation levels.
