ward continuation of said relate in the bottom of said box, a spring | pivoted together, and formed with an upper narrow jaw and a lower (c), secured in said growe and having an upward projecting head or plate g, an oblique deflecting plate H in the relate c, a perforation a¹¹, in the side of the box opposite said spring head, a spring E pressing said sliding bottom towards one end, and a projecting lever F, adapted to draw in the opposite direction, substantially as set F, adapted to draw in the opposite direction of a leve A adapted. forth. 3rd. In a match safe, the combination of a box A, adapted to be lecked, a perforation att, at one side of said box near the lattom, a platform A¹¹ upon which said box is secured, a butt A¹¹¹ upon said platform opposite said perforation and means to eject a match from raid box through said perforation at will, substantially as set forth. 4th. In a match safe, the combination of a box A, adapted to be locked, a longitudinal sliding bottom in said box. sloping ends inside said box extending to said sliding bottom, a perforation a^{\dagger} in the top, a perforation d in one of the sloping ends, a lever F passing through said perforations and bent at a right angle at a point at which it passes through the sloping end forming a support in said perforation and bent at a right angle at the point a support in sact permutation and tent at right angles are plant at which it passes through the top and engaging said sliding bottom at the lower end by a clevis F', substantially as set forth. 5th. In a match safe, the combination of a rectangular box, a groove b in the bottom adjoining one side, a bottom adapted to slide with its edges against the sides and having a relate c above said groove, a side of the bottom adjoining a relate c. flat spring secured to the side of the box in said groove, a plate or head at one end of said spring projecting upwardly in said relate tending to press against the bottom side of said groove and edge of the relate, and a deflecting spring plate H, projecting obliquely across said relate and adapted to engage deflect and pass said spring head when said sliding bottom is moved in one direction and passing between said head and the box side when moving in the other direction, substantially as set forth. Gth. In a match safe, the combina-tion of a box, a bottom adapted to slide longitudinally therein and carrying a match transversely in a groove, a spring drawing said sliding bottom to one end of the box and a lever adapted to draw it towards the other end against the pressure of said spring, substantially as set forth.

Method of and Machine for Making Shingles (Méthode et machine pour fabriquer Xo. , 44,574. le Sardeau.)

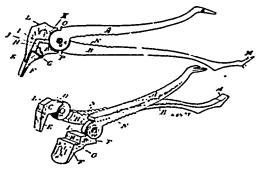

The International Shingle Machine Company, assigned of William F. Hutchinson, all of New York, State of New York, U.S.A., 2nd April, 186; 6 years.

Cham.-1st. A method of making shingles, which consists in turning from a log a stripof veneer levelled from edge to edge, and then solitting the strip transversely to form the shingles. 2nd, The splitting the strip transversely to form the shingles. 2nd. The berein described method of turning veneer for shingles, which consists of feeding against a retating log, knives having opposite juch whereby two levelled veneer strips are turned, with the thick edge of one strip opposite the thin edge of the other. 3rd. The herein described method of making shingles, which consists in cutting a strip of veneer, thick on one edge and thui on the other, and of a strip of veneer, thick on one edge and thut on the other, and of a swidth equal to the length of the shingles, and then splitting the strip transversely into shingles. 4th. A veneer cutting machine, having the usual means for rotating a log, and knives of opposite pitch adapted to be fed against the different sections of the log, substantially as described. 5th. A rotary veneer cutting machine, comprising the usual means of clamping and rotating a log, and also the customary means of feeding the knives, and a pair of knives arranged on opposite sides of the machine, the knives having opposite pitch and being adapted to feed simultaneously towards the log, substantially as described. 6th. As an immoved article of many me juten and reing adapted to teed simulaneously towards the log, substantially as described. 6th. As an improved article of manufacture, a rotary vener machine, having on opposite sides veneer cutting knives with the usual feed and of opposite horizontal jatch, the edge of one knife projecting upward and of the other knife downward, substantially as described.

No. 48,379. Implement for Lifting Pans.

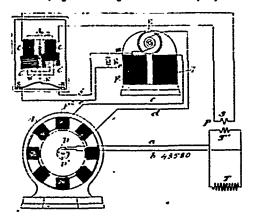

James T. Watkin and James Shanon Bradley, assigners of William C. Bayless, all of Mossy Creek, Tennessee, U.S.A., 2nd April,

broader jaw, said lower jaw provided at its lower end with a gripping

part F, and immediately above said gripping part with a horizontal ledge or seat G having a vertical rear wall H communicating with a horizontal ledge or seat I, substantially as described.

No. 48,580. Regulator for Electric Generators. (Régulateur de généraleur électrique.)

The Canadian General Electric Company, Toronto, Ontario, Canada, assignee of Elihu Thomson, Swampscott, Massachusetts, U. S.A., 2nd April, 1895; 6 years.

Claim.—1st. The combination of a dynamo with a separate exciter therefor, and an electric circuit controlling the potential of the exciter, a switch adapted to close or break said circuit, and an electro-magnetic device responsive to changes in the potential of the main forth. 2nd. The combination of a dynamo with a separate exciter therefor, means for regulating the potential of said exciter, and an therefor, means for regulating the potential or said exciter, and an electro-magnetic device controlling said regulating means, said device comprising an electro-magnet arranged to respond to changes of potential in the main circuit, and a closed coil or circuit movable under the influence of said magnet. Srd. The combination, with a dynamic of a separate exciter, and means, substantially as described, whereby a portion of the field winding of the exciter is rendered account or impossible to the abstract or impossible to the exciter in tendered. operative or imperative by the change in potential of the main circuit. 4th. The combination, with a dynamo of a separate exciter, having a portion of its field winning included in a shunt, said shunt being controlled by the varying potential of the main circuit, substantially as set forth. 5th. The combination, with a dynamo of a stantially as set form. Sen. In communicate, with a typianic of a separate exciter, having a portion of its field magnet included in a shunt, and an electro-magnet arranged to open and close said shunt, said magnet bring controlled by a change in potential of the main circuit, substantially as set forth. 6th. The combination, with a dynamo of a separate series-wound exciter, having a portion of its field magnet included in a shunt, an electro-magnet controlling said shint, said magnet being in turn controlled by a change in potential shint, san magnet leing in turn continued by a change in potential of the main circuit substantially as described. 7th. The combination, with a dynamo of a separate exciter, having a portion of its field winding included in a shunt, an electro-magnet arranged to respond to changes in the potential of the main circuit, and an axially movable helix concentric with said magnet, and adapted to close and open said shunt, substantially as described. 8th. The combination, with a dynamo of a separate exciter, having a portion of its field winding included in a shunt of ne meistance an electron command, with a dynamo of a separate exciter, having a portion of its field winding included in a shunt of no resistance, an electromagnet. Watkins and James Shanon Bradley, assigness of William C. Hayless, all of Mossy Creek, Tennessee, U.S.A., 2nd April, 1895; 6 years.

Chaim.—The herein described unplement, comprising two handles; an exciter E, F, F', having the shunt, a, f, provided with the con-
