

therefore somewhat difficult to move; but small specimens may be transplanted successfully, and will thrive in almost any soil and location; yet sandy loam and a sunny position are most favorable for their growth. The plants should be taken up in the fall after flowering, or early in spring. For adding color to a group of evergreen shrubs in a lawn during late summer and early autumn, nothing can be more effective than a few clumps of these *Asclepias* planted along the outer border.

QUESTION DRAWER.

MR. EDITOR.—Wishing *The Horticulturist* every success, and hoping to see it soon become an interesting journal in the home of every farmer in our fair Dominion, I would beg leave to offer a few suggestions. Would it not be well to give a page or two expressly for questions to be asked by anyone wishing information, and answered only by practical and experienced men on horticulture, and any question pertaining to farming. For instance, I will ask this question. What is the best mode of cultivating a vineyard!

A. COLE.

In reply to A. C., I would say that as soon as the ground is dry enough in the spring to plough, I commence by ploughing from the vines not deeper than four inches. By using one horse to plough the last two furrows next to the trellis, I can plough all the ground except six or eight inches; that space will have to be worked with the hoe; then after a week harrow the ground well. After two or three weeks more I plough again to the vines, using a plough that will throw the furrow well to the centre, then keep the ground well cultivated until the middle of August, no more to be done until after the fruit is gathered. As soon as the fruit is all taken off, give it another cultivating to prevent the weeds from going

to seed. Just before winter sets in, open the furrows between trellises to keep the water from lying on the ground. By no means plough the ground in the fall; it needs to be left as solid as possible for winter.

FARMER AND FRUIT GROWER.

What is the best mode of trellising a vineyard, eleven feet between canes, ten feet between vines.

A. COLE.

Editor's reply to Mr. Cole's suggestion, that the Question Drawer is always open, and any questions received will be published, and any replies sent in will appear in the next number. The Editor will be most happy to receive questions at any time, and hopes that readers will be free to avail themselves of this method of eliciting information on any desired subject.

Will some of our grape-growing readers please reply to Mr. Cole's inquiry concerning the best mode of trellising grape vines?

What profit may be expected in a favorable season from—1st, ten acres of peaches, and 2nd, ten acres of apples respectively? 3rd. Can apples be grown profitably in the neighbourhood of Lindsay; and 4th, if so, what kinds?

SUBSCRIBER.

This question was submitted to the meeting of the Fruit Growers' Association recently held in Woodstock, and the following replies elicited:

1st and 2nd.—One hundred dollars per acre.

3rd.—I think so.

4th.—Duchess of Oldenburg, Ben Davis, Golden Russet, Alexander, Wealthy, Grand Sultan, Talman Sweet.
