Making the Little Farm Pay

By C. C. BOWSFIELD

spinach, peas, carrots, beets, radishes, onions, etc., may be safely planted as early as the ground is in good workable condition and free of frost, while beans, melons, squash, cucumbers, and corn should not be planted until the soil becomes warm and the temperature at night does

and the temperature at hight does not go much below 55 degrees.

Tomatoes may be set out at this time, but eggplant and peppers should be delayed until the temperature remains at 60 to 65 degrees at night. Early lettuce should be sown in the hotbed, greenhouse, or window garden early in Moreh and window garden early in March, and if the plants are properly hardened

beforehand they may be safely planted to the garden as soon as they attain a height of two inches. Make a second sowing as soon as first plants are ready to set out. likewise a third

sowing when the second lot of plants are ready for setting out, and so on until the season becomes too far ad-

until the season becomes too far adwanced and the weather too warm for
the lettuce to head.

The round, smooth peas may be
sown as soon as the ground can be
worked; they will bear considerable
cold without being injured, both before and after they are up, but if
there is no object in having them
come on very early it would perhaps
be better to delay planting until the
ground becomes somewhat warm, ground becomes somewhat warm, when the early, midseason and late varieties may be sown the same day. A pint of seed will sow about thirty-six feet of row. After the peas are cleared off the ground may be plant-ed to string beans, early sweet corn,

cabbage or celery.

Of carrots and beets make two sowings, about two months apart.

Musk-melons, cucumbers, and early and late sweet corn may be planted in the same ground all on the same day. The hills for melons and cu-cumbers should have at least two shovelfuls of well rotted stable manure mixed with the soil. In the common method the rows are three and one-half feet apart and the hills of

one-half feet apart and the fills of melons and cucumbers six feet apart in the rows.

The tomatoes, pole limas, squash, peppers and eggplant should be fertilized in the hill with old well rotted stable magure. One shovelful to each hill of lima beans will be sufficient while the towaters of should cient while the tomatoes, etc., should

that two good shovelfuls to each hill.

In all cases mix with the soil.

The soil for lettuce, spinach, radishes, carrots, and beets should be well enriched with heavy applications of well rotted stable manure applied breaders, and worked well into the proadcast and worked well into the If you got in a sowing of garden

peas early in March put in another at the end of the month. If you want to get very early cabbage, cauliflow-er, and lettuce plants into the ground

er, and lettuce plants into the ground by the 1st of April remember to begin to harden them off in the hotbeds by the middle of March or perhaps ten days before setting them out.

Do not uncower the strawberries too early. Toward the end of March will be time enough. Wait, in fact, until they begin to grow.

Sod is excellent for tomatoes. Some of the largest crops have been grown after sod. A handful of fertilizer in the hill starts growth, and the sod furnishes plant food for maturing the crop. It is best, though, to plew the sod in early fall and to plow the sod in early fall and leave the furrows exposed to the ac-tion of frost and the elements during the winter. In the spring get on the ground early and harrow frequently

until planting time.

It is well to broadcast manure for onions on top of the ground after plowing. This is then harrowed in with a disk harrow and thoroughly incorporated in the soil before onions are planted.

Garlic is easy of culture and will succeed on any soil that is suitable for onions. It is grown or propagat-ed by dividing the bulbs, which are listed by the seedsmen as cloves or sets and can be procured from any of the large seed houses. They are planted as early in spring as the ground is in condition for working in rows twelve to fifteen inches apart and from five to six inches apart in the row.

If the rhubarb produced small stalks last year dig up and divide the roots, planting in a deep trench, covering with a rich soil.

STARTING ALFALFA EARLY.

Seed Bed Should Be Well Prepared and Compact.

Starting alfalfa on the jump requires that the seed bed be well prepared and then that the plants are given plenty of plant food, says the Home and Farm. Alfalfa requires a rather compact seed bed. Its preparation depends on the preceding crop.
Investigation of the methods of the

eading growers of alfalfa shows that the general practice is to plow the ground early, harrow every week or ten days until the weeds are all killed and the fine, firm bed that is required is obtained. Many farmers have got good stands by seeding in the corn before the last cultivation.

When alfalfa is seeded after early truck crops the need of summer fal-lowing is eliminated and the farmer gets a market crop during the same season. The land does not need to be plowed after the spring truck crop is taken off, but should be harrowed and disked and allowed to settle for ten days to two weeks. To secure quality seed it is best to test several different samples for pu-

rity and vitality. Ten to fifteen pounds of seed is the amount recomnended. Five to twenty-five pounds are recommended by other stations. The differences in results are slight. Lime must be added if the soil is sour. Limestone at the rate of two tons per acre will correct the acidity, or upward of one and a half tons of hydrated lime may be used for quick-er results. From 200 to 500 pounds of complete fertilizer, high in phos-phoric acid, should be applied pre-
