

Doloment, the New Stone-Wood Flooring

The Establishing in Canada of this Concern and Its
First Year of Wonderful Progress

AN event which has proven of great importance to architects and builders was the establishing in Canada of a company for the manufacture of Doloment, the jointless stone-wood flooring. On January first of this year the Canadian Doloment Co., Limited, was formed with a capital of \$100,000; but its business developed so rapidly that six months later the Colonial Doloment Co., Limited, was formed with a capital of \$500,000 and the original company was merged with it.

The patent rights for Doloment, which is a German invention, are vested in this company, the capital for which

was subscribed by an English syndicate, of which Mr. E. Hatheway Turnbull is managing director. The head offices of the Canadian Doloment Co., Limited, are in the Mark Fisher Building, Montreal, but as its operations are spreading all over Canada they are opening agencies in all the larger cities.

The reason for the immediate success of Doloment in Canada is that it has proven to be the only jointless stone-wood flooring that has met the demands of architects and builders.

The great difference between Doloment and all other stone-wood floors is its semi-elastic lower layer. As this
