with which it agrees. There is a yellowish streak upon the throat, but not a white patch as is sometimes the case. The outer tail-feathers are devoid of white, showing that the specimen is a female. The wings are barred with yellowish red, and minutely sprinkled with brownish black. The exact length could not be ascertained with certainty, but is probably about eleven or twelve inches. Mr. McKinlay says "it may in all sincerity be pronounced a bona-fide Chuck-will's-widow." It was reported, he says, that the cries of the species had been heard at certain times, but such, he continues, has not been properly substantiated. At first I was very doubtful about inserting the species in my notes, for it seemed more probable that the specimen was a Whippoorwill, whose upper parts are somewhat similar in colour; later information, however,—especially
