

The Acadian Scientist.

Published in the Interests of the Acadian Science Club.

VOL. I.

WOLFVILLE, N. S., JUNE, 1883.

No. VI.

Subscribers finding a blue mark before this notice will please understand that their subscription expires with the present number, and renew.

The subscription price is only thirty-five cents a year, Canadian or United States stamps taken; denominations of 1 cent or 3 cents preferred.

WE trust that the public school Teacher will recognise the fact that the SCIENTIST is devoted to *his* interest also, and give us his support. We aim to give each month such notes and articles as will be of value to him in the discharge of his professional duties. We intend to double the size of the SCIENTIST as soon as circumstances will allow—probably in a few months. It will then be a sixteen-paged journal. Should it be found necessary to increase the subscription price, those subscribing now will receive the SCIENTIST a full year.

THE SCIENTIST'S DEVOTION.

There is something in the mind of man that delights in the search for truth and rejoices in its discovery. In this fact lies the secret motive that impels the scientist to devote the laborious days of a busy life to the duties of his chosen profession. The mineralogist will travel weary miles around rocky shores and over mountain sides, apparently only for the purpose of adding a few specimens to his cabinet. The geologist will rend asunder the rocks of the earth's strata in search for

hidden fossils, while days and weeks will be spent in classifying them according to their distinguishing characteristics. The entomologist will spend precious time in the study of some minute insect, and in writing whole pages of description utterly void of interest to the general reader. But no one has a greater love for his work, as such, than these same men; and when, after years of patient study, some new truth is discovered, adding to the world's knowledge, or some beneficial fact made available to the use of man, the scientific worker experiences a more tangible reward.

Through the labors of the scientist the hidden treasures of the earth are spread at the seeker's feet; the farmer and manufacturer helped to better methods and saved from much costly experimenting; and men in all departments of active life led to see more excellent ways and assisted to a more efficient expenditure of labor and capital. As the result of his keen research the subtle forces of nature are made more subservient to the use of man—so that thereby whole streets may be lighted up in an instant, as if by magic, and friend converse with friend though separated by half a continent.

It is not difficult to account for the
