

SUMMER DIARRHŒA. — In the large class of summer diarrhœas of children and adults, with griping in the bowels and flatulence, the use of listerine, in doses varying from ten drops to a teaspoonful (with or without water), has a most salutary and pleasing effect. It can be administered at short intervals after eating, as soon as regurgitation, distension or acidity occurs. Its action in arresting excessive fermentation is prompt; besides, it exercises a decided sedative influence on the mucous membranes of the stomach. The thymol, menthol and boracic acid which, with the quota of alcohol necessary to their proper admixture, form the principal elements of listerine, lend to this compound a special value in this class of cases.—*New York Medical Journal.*
