PREVENT APPLE SCAB Much of the Loss Through This Disease Is Needless.

Careful Spraying Will Do the Trick -Three Sprayings Necessary-Either Lime Sulphur or Bordeaux Mixture May Be Used.

Contributed by Ontario Department of

most serious disease of apoles in Ontario. It occurs wherever apples are grown is the leaves and fruits by growing arger develop more surface to cover In order to be sure of preventing the sease we must spray from three to per of sprayings depending upon whe er the weather is wept or dry. The grower is certain that there is San Jose Scale in the orchard and very little Oyster Shell Scale, a weaker solution may be used, 1 gallon to about 20 gallons of water, or 3or deaux mixture 4.4.40 formula may

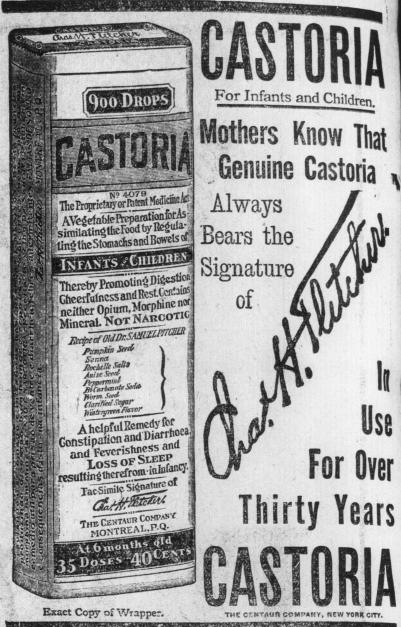

The second spraying should be given just before the blossoms open, hat is, just when they are showing pink, using commercial lime-sulphur strength 1 gallon to 35 gallons of water, or Bordeaux mixture 4.4.40

after the blossoms have all or nearly ill fallen, with lime-sulphur strength gallon to 40 gallons of water. This generally the most important spray or the control of Apple Scab and al ways for Codling Moth, and it must be promptly applied, as a delay of or two may make all the differ ence between success and failure Bordeau mixture should not be used cause the fruit to be russeted. Arsenate of lead should be added for the second and third sprayings to control Codling Moth and other biting

In seasons of normal weather conlitions these first three sprayings should control the scab completely. In some seasons, however, additional applications are absolutely necessary if the scab is to be prevented. The we get our cold, wet weather. In some seasons there is a long period of cold, wet weather between the date when the blossoms begin to burst and when they fall. Sometimes the length of this period is three or four weeks. In such cases it is necessary to give an intermediate spraying between the second and third Hence, if the grower finds at the end of twelve days or two weeks after he has applied the second spray that the weather is still cold and wet and development of the blossoms is very slow, another spraying should be given at once to protect the young blossoms and foliage. This should be of the same strength as for the third regular spraying, but poison should is very important to observe carefully the weather conditions and apply this spray when necessary. Spraying early in August is an insurance against late infection of Apple Scab and Sooty Fungus. In wet autumns such spraying is necessary to prevent late attacks of scab, especially with varieties such as Mc-Intosh Red and Snows, which are very susceptible to scab. For this application use a weak lime-sulphur solution, 1 gallon to 40 or 45 gallons of water, or Bordeaux mixture. No oison should be used at this time. Often if the spraying is done later than the first or second week in August there is a chance of the fruit Should the dust method prove satisfactory it could be used at any time n the fall without danger of staining the fruit. If the early sprayings are thoroughly done, and the fall is not extremely wet, usually the crop will emain clean without this last appli

Thoroughness In Spraying .- Very lew men spray thoroughly enough fungicide (a substance which destroys sulphur or Bordeaux mixture, so that when a spore reaches leaf or fruit it is destroyed and cannot grow and cause scab. We see, therefore, that f spraying is to accomplish it's object every fruit and leaf must be completely covered with the fungicide so which a spore can germinate. Thor ough spraying necessitates the lib
