Activity in Automobile Patents.

By all odds the automobile section is the busiest of all the divi-

sions of the Patent Office these days.

Since all the fashionable world has

taken to automobiling, and this

sport is no longer a fad, the inven-

tors of the country seem to have

turned their attention to bringing

out improvements in motors, car-

riages and other parts. The number

of applications that are being re-ceived for patents on devices for

automobiles is so great that it has found necessary to have five

special examiners on this work. Four

separate divisions have been organ-

ized to which are referred papers, ac-

cording to the specific kind of pat-

out for the compressed air motors.

female weakness.

Going down to the sea in ships is generally regarded as risky business. Even persons who would take their lives in their own hands are squeamish about putting them into other persons' hands. This squeamishness doesn't keep many of them ashore, but it makes most men, and probably all women, wish they knew how many lifeboats stood between them and

a watery grave. When the manager of one of the lines of ocean steamers was asked what preparation his company makes for saving pas-sengers in case of accident, he said: "In the first place, we don't expect to

have an accident. "But if you do?"

"Then we have lifeboats, life preservers, life rafts, lifelines and all the paraphernalia required by law. Our steamers sail between New York." ers sail between New York and an English port and are therefore subject to the regulations of the British board of trade well as to the American rules. In order to clear a vessel carrying passengers from a British port we must be inspected or surveyed by the British surveyors before we can get a certificate. This has to be done before every departure from their ports. That means we are surveyed by their inspectors every few weeks. When that takes place, all our fire apparatus is examined, and we have to go through a part of the boat drill. A certain number of the lifeboats are swung overboard to show that the davits are in working order, and one of them is lowered to the water.
"We used to have drills at sea, but

that meant that the whole ship's company must appear on deck. The firemen came up in their undershirts or without them, as the case might be. The stewards, the cooks, the butcher, and the baker, and the scullion—everybody turned out. It wasn't what you might call a dress pacade, and we gave it up. Drills are had in port now. We have lifeboats with a carrying capacity of 1,500, although we rarely have more than 1,300 or 1,400 souls aboard. When we have carried over 1,500 out from England, we put en rafts

A big ocean steamer carries a whole fleet of lifeboats. Here is the list of the boats corried by one of the German steamers: Ten steel boats of a capacity of 520 cubic feet each, two steel boats of 350 cubic feet each, twelve collapsible boats of 304 cubic feet each and two wooden ones of 124 and 155 cubic feet respectively. The cubic capacity of a boat is of interest because upon that depends the number of persons it can carry. According to the law in this country, the cording to the law in this country, the carrying capacity of a lifeboat on an ent that is demanded. One divided that is demanded that is demanded. One divided that is demanded that is de sult by ten. According to this rule, each of the largest steel boats above mentioned would be allowed to carry thirty-one pas-sengers. As a matter of fact, they are ex-

pected to carry fifty or sixty.

The lifeboats are always ready for use. They are not elaborately stocked, but each one carries a certain list of articles stowed away so as to economize space as much as possible. Each boat contains two casks of water, a case of ship biscuit, nine oars, extra oarlocks, sail and mast, fireworks for making signals of distress, lamps, oil, boat compass, axes, rope ladler with wooden rungs, bailers and plugs for stoppinig leaks.

The shipping regulations in this country require an annual inspection of ers which "must be made only on written application" by the owner, master or authorized agent. Our shipping laws are modeled on those of Great Britain, but in this respect are considerably less rigor-ous. We have no inspector to see that there is a fire drill or that the life saving appliances are ever tested, except once a year "on written application."
The certificate then issued is good until the next annual inspection. As for the drills, there is a law requiring them to take place once z week, and the fact that the drills are held to be entered in the logbook. Excellent law. If the drill is al-ways held and recorded and the busy inspector looks through the logbook for the whole year and satisfies himself that it is all there, then the excellent law is most

excellently observed. Here is the British regulation for the inspection of steamers carrying passengers from British ports: "A ship shall not clear outward or proceed to sea on any voyage unless she has been surveyed un-der direction of the immigration officer at the port of clearance, but at the expense of the owner or charterer thereof, by two or more competent surveyors, to be appointed, etc. The survey shall be made before any portion of the cargo is taken on board, except so much as may be necessary for ballasting the ship and such portion, if laden on board, shall be shifted

if required by the surveyors."
While the proportion of passengers lost at sea is remarkably small, the propor-tion of those who die at sea is still smaller. Obscure persons unaccompanied by friends are recommended not to shuffle off their mortal coil on shipboard unless they have a fancy for being buried at sea. Steerage passengers who die-and they form the majority of those who do-are always buried at sea and in very short

In the case of cabin passengers it all depends on circumstances. All steamers carry one special coffin, but as a general thing only one. This can be hermetically sealed and would be used for bringing inte port the body of any one of especial consequence or of any one accompanied by friends who objected to a burial at sea,

If a man was not well known and was unaccompanied by friends, his body would not be carried to port unless the ship was only a day or two from landing. The steamship man who gave this information said it was rather a delicate ques mation said it was rather a delicate question whether a corpse had any rights. He did not know whether the friends of a person who had been buried at sea would have a right to protest because his body had not been brought to them. The captain's word is law aboard ship, and if he chose to bury anybody who had did he chose to bury anybody who had died he would probably be within his rights.-

"Hair singed, sir?" the barber said, with a rising inflection.
"What good does it do to singe it?" demanded Mr. Tyte-Phist.
"Makes it grow better."
"So you can get to cut it oftener, hey?" said Mr. Tyte-Phist fiercely. "No, sir!

said Mr. Tyte-Phist fiercely. It grows too blamed well now!"-Chicago

MOUNTAIN CLIMBING.

KILL, PRUDENCE AND EXPERIENCE NECESSARY TO SUCCESS.

The Dangers and the Perils of Ascent and the Methods of Avolding Them Described by a Veteran Alpinist. How Accidents Happen.

Mountain climbing is a craft which has a twofold object-the attainment of the point which it is desired to reach and the avoidance of accident in so doing. The first is gained by skill, the second by prudence and experience. Accidents are caused either by things falling upon the climber or by the climber himself falling. When I speak of accidents, I mean practically unavoidable misfortunes. More than half the deaths that annually occur on the Alps are caused by neglect of the most rudimentary precautions and are not properly accidents. True Alpipe accidents are those which occur in spite of foresight and precaution. They have al-ways been few, and when the continually creasing number of climbers is reckoned they may be said to decrease rather than

ncrease in frequency.

The things that by falling upon a climbing party may produce fatal results are rocks, ice and snow. All rock mountains are falling to pieces—some faster than others—under the alternate frost and Water trickles into cracks on a warm day. At night it freezes and in freezing expands. It thus acts like a wedge to widen the cracks and tear rocks asunder. Thus the whole face of most rock mountains is cumbered with loose stones balanced on ledges to fall when the least impulse is applied. One stone in motion starts others and they in turn many sing carry both one-lourin of a mile and never stop to rest. I am as heavy as I was at 19 years (125 pounds). I used thirty bottles of 'Favorite Prescription' and 'Golden Medical Discovery' and twenty-five vials of 'Pleasant Pellets,'"

Dr. Pierce's Common Sense Medical more. In this manner a whole rock face may be swept by myriads of falling rocks of all shapes and sizes. Such falls are fairly common on the east face of the Matterhorn. That is why the route followed up it keeps as close as possible to

he edge of the face. Rock faces are usually furrowed with tracks called gullies and couloirs, worn by the stones falling down them. If a gully is straight, stones generally fall down the middle of it, and the sides may be climbed in comparative safety. Some faces of rock are less liable to be stone swept than others. others. An experienced climber knows the signs of danger. When there is much recently fallen snow on a rock face, stones do not fall so often as when the snow is all melted away. A good climber bears all these facts in mind and knows what to look out for.

As with stones, so with ice. It does

not fall anywhere and anyhow. It has its habits, which may be learned by observation. Except in the lower part of a glacier lce seldom appears on the surface. People talk vaguely of ice when they mean hard frozen snow. Where a glacier descends a very steep and uneven slope it breaks up into great lumps of ice, which are called seracs. Seracs often tumble, but seldom in the early part of the day. It is generally easy to perceive whether a given serac is ready to fall or whether it is firm. A well chosen route avoids the track where the serac may be expected to fall. The crests of some narrow snow ridges are fringed with an overhanging wave of ice, called a cornice. Cornices grow slowly by accretion of snowflakes. When they become too big, they fall, and woe to the man on whom they fall! The wise man does not pass

inder a great cornice. Falling snow is called a snow avaways a lawyer.

Half a loaf is better for you than easily recognizable tracks. Most of them fall in springtime, before climbing gins. The summer avalanches fall after fresh snow has accumulated during bad weather. Avalanches, however, seldom fall on climbers. Usually an accident is caused by the climbing party starting an avalanche. Professor Tyndall nearly lost his life in this way. He was crossing a steep slope of snow in the afternoon, after it had been softened by hot sunshine. It cracked across, and the whole surface -a foot deep or so-slid down, carrying his party with it. By good luck they escaped from the rear of the avalanche before reaching the edge of a cliff, over which it fell. A prudent climber avoids rossing rotten snow slopes that are steep. Most accidents, however, are caused by falls from rocks, fce or snow. Careful climbers seldom fall from rocks. They to not undertake ascents that are beyond

band around there and show him your name? It would be such a He is a wise man who wastes no energy on pursuits for which he is not fitted.-Gladstone. the skill of their party. If the guides are Gall and wormwood are both used in good enough for the particular climb, two making imported wine in this country. The man who labels it supplies of them will render any tolerable climber safe by proper use of the rope. they are moving he keeps still. When moves, they remain firmly planted and When you see a girl with only one draw in the rope as he advances. If he

glove on, it's a sign that she has a new ring on the other hand. slips, they easily hold him.

A fall from ice is less easy to check. The dangerous places are steep slopes of real ice—hard blue ice like the surface of A bachelor objects to female barbers a frozen pond set up at an angle. Steps cut in such material are themselves quite slippery. If a slope of this kind is very on account of a disastrous haircut a certain Mr. Samson once received at long and takes perhaps hours to ascend, the time comes when carelessness in footing or balance may lead to a slip. If the nan ahead is immediately above the one who slips, he can hold him easily, but if the ascent, as is probable, is being made diagonally, a slip is more difficult to arrest, and the whole party will be in great

> From slopes or ridges of snow men are not likely to fall unless they are overthrown by a sudden blast of storm, as has happened once or twice. Even then a fall may be arrested by using the ax as a brake if the surface of the snow be not too hard frozen. The chief danger on snow is that you may fall through it into a hidden crevasse. It sometimes hap-pens after a fresh fall of snow that a crevasse is completely covered up so that not a sign of it can be perceived even by the most experienced eye. Against this peril, however, there is one certain profection. It is the rope, rightly used. If tection. It is the rope, rightly used. the members of a party are joined, as above the snow line they always should be, by a good rope firmly knotted round the waist of each, with a distance of from ten to fifteen feet between a man and his religible to the snow he not allowed neighbor, and if the rope be not allowed to dangle on the ground, it will be a matter of indifference whether one falls into ter of indifference whether one falls into a crevasse or not. Before he is more than waist deep the rope will hold him, and he will be able to scramble out without difficulty or damage.—Sir Martin Conway in London Mail.

of Course He Was a Brute. Mrs. Stalor-John, don't you think I need a new gown? This one is beginning

Mr. Stalor—I don't see anything the matter with it. You look well enough in it to suit me, and why should I pay out money to make you more attractive to

STYLE

Has but little to do with the cost of a carriage, but it has everything to do with its appearance. It costs as much to build a very ordinary appearing vehicle as a stylish one, if the same quality of material is used and the same care exercised in its construction. Some carriage builders know how to build stylish vehicles better than other builders; but they do not charge you anything for the "Know how." They charge you only for the material put into it and the labor expen-

ded upon it Thus the quality being equal, two carriages cost the same, even if one of them presents a stylish appearance while the other one is lacking in that qualification.

Long experience, and a keen appreciation of the beautiful in carriages has enabled us to make the choicest of Buggies and Carriages and other vehicles that are in popular demand. We sell them at the same price we would if the stple wasn't there.
