☐ Big savings can be effected by arranging power drives so that all machines are properly loaded. The best means of knowing what your equipment is doing is by taking readings with Esterline True Recording Wattmeters.

☐ The illustration shows one of the Portable Type, which is placed in an aluminum

case with a glass face. The clock has an eight-day lever movement controlling the chart which is six inches in width and twenty-six feet long. A special inking device has been arranged for the marking of these charts. The holder will contain a supply for eight days and the ink is drawn through a tube to the pen by capillary action.
