## Miscellaneous.

**For Delicate Sickly Children**  
Scott's Emulsion is unequalled. See  
what Dr. C. A. Black, of Amherst, N.  
S., says: "I have been acquainted  
with Scott's Emulsion of Cod Liver Oil,  
with hypophosphates, for years, and  
consider it one of the finest preparations  
now before the public. It is pleasant  
to the taste, and the great favorite for  
children, and I do highly recommend it  
for all wasting diseases of children and  
adults. Put up in 50c. and \$1 size.  
a 17-4w

A lady being questioned in Court the  
other day as to why she had changed her  
religion, stated she had done so be-  
cause, being separated from her hus-  
band, she determined to avoid meeting  
him in the next world.

Disorders of the stomach, liver, and  
kidneys, can be cured by restoring the  
blood to a healthy condition, and giving  
the vitalizing and cleansing action of  
Ayer's Sarsaparilla. It is the safest,  
most highly concentrated alterative  
available to the public.

At Waterloo, a Highland regiment, the  
Scotts Greys, met in the thickest of the  
fight and were "cut to pieces."  
"And could Ireland for longer?"  
exclaimed an Irish dragoon.

When used according to directions,  
Ayer's Sarsaparilla is guaranteed to  
eradicate, from the system, Fever and  
Ague, Intermittent, Remittent, and Bilious  
Fever, and all malarial diseases. Try it.

A little girl being asked if she had an  
ear for music, replied: "Yes, I believe  
I have, for I heard the cotton gin rattle  
when a man was playing on it at least  
200 yards off."

**A Big Mistake.**  
The moulting season for the season when  
hens shed their feathers will soon be at an end.  
The process is one in which certain respects de-  
termines and prevents hens from laying. The  
reason of this is that the growing of new feathers  
requires all the nitrogen and phosphates con-  
tained in the food and there is none left to  
form the egg. A curious fact about the hen,  
and one that illustrates the foregoing  
statement, is that if a hen is moulting during  
the laying season, she will lay her eggs with-  
out shells until the moulting is ended. The  
reason for this must be that all the lime con-  
tained in the food is required to unite the  
feathers, and there is none left for the  
formation of egg shells. The formation of new  
feathers does not require any carbonaceous or  
fat producing food, consequently, well fed  
hens get very fat during the moulting. Many  
farmers and poultry raisers have lost their  
flocks because they have stopped laying  
all about some thing which they have  
been told. This is a great mistake, because  
if the proper material be furnished them with  
their food to supply the increased demand for  
nitrogen and phosphates before mentioned,  
old hens will be through shedding feathers  
much sooner and will begin laying on the  
approach of cold weather, and they will con-  
tinue to lay vigorously all winter, while the  
young pullets, instead of taking the moulting  
season, may not begin to lay until much  
later in the season. Very many people have  
been misled by the fact that the moulting  
season is a time when the hens are not  
laying, and they have concluded that the  
moulting season is a time when the hens  
should not be fed. This is a great mistake,  
because if the proper material be furnished  
them with their food to supply the increased  
demand for nitrogen and phosphates before  
mentioned, old hens will be through shed-  
ding feathers much sooner and will begin  
laying on the approach of cold weather, and  
they will continue to lay vigorously all  
winter, while the young pullets, instead of  
taking the moulting season, may not begin  
to lay until much later in the season. Very  
many people have been misled by the fact  
that the moulting season is a time when  
the hens are not laying, and they have con-  
cluded that the moulting season is a time  
when the hens should not be fed. This is a  
great mistake, because if the proper material  
be furnished them with their food to supply  
the increased demand for nitrogen and phos-  
phates before mentioned, old hens will be  
through shedding feathers much sooner and  
will begin laying on the approach of cold  
weather, and they will continue to lay vig-  
orously all winter, while the young pullets,  
instead of taking the moulting season, may  
not begin to lay until much later in the  
season. Very many people have been misled  
by the fact that the moulting season is a  
time when the hens are not laying, and they  
have concluded that the moulting season is  
a time when the hens should not be fed. This  
is a great mistake, because if the proper ma-  
terial be furnished them with their food to  
supply the increased demand for nitrogen and  
phosphates before mentioned, old hens will  
be through shedding feathers much sooner  
and will begin laying on the approach of cold  
weather, and they will continue to lay vig-  
orously all winter, while the young pullets,  
instead of taking the moulting season, may  
not begin to lay until much later in the  
season. Very many people have been misled  
by the fact that the moulting season is a  
time when the hens are not laying, and they  
have concluded that the moulting season is  
a time when the hens should not be fed. This  
is a great mistake, because if the proper ma-  
terial be furnished them with their food to  
supply the increased demand for nitrogen and  
phosphates before mentioned, old hens will  
be through shedding feathers much sooner  
and will begin laying on the approach of cold  
weather, and they will continue to lay vig-  
orously all winter, while the young pullets,  
instead of taking the moulting season, may  
not begin to lay until much later in the  
season. Very many people have been misled  
by the fact that the moulting season is a  
time when the hens are not laying, and they  
have concluded that the moulting season is  
a time when the hens should not be fed. This  
is a great mistake, because if the proper ma-  
terial be furnished them with their food to  
supply the increased demand for nitrogen and  
phosphates before mentioned, old hens will  
be through shedding feathers much sooner  
and will begin laying on the approach of cold  
weather, and they will continue to lay vig-  
orously all winter, while the young pullets,  
instead of taking the moulting season, may

orously all winter, while the young pullets,  
instead of taking the moulting season, may  
not begin to lay until much later in the  
season. Very many people have been misled  
by the fact that the moulting season is a  
time when the hens are not laying, and they  
have concluded that the moulting season is  
a time when the hens should not be fed. This  
is a great mistake, because if the proper ma-  
terial be furnished them with their food to  
supply the increased demand for nitrogen and  
phosphates before mentioned, old hens will  
be through shedding feathers much sooner  
and will begin laying on the approach of cold  
weather, and they will continue to lay vig-  
orously all winter, while the young pullets,  
instead of taking the moulting season, may  
not begin to lay until much later in the  
season. Very many people have been misled  
by the fact that the moulting season is a
