American Summer Pearmain,	Summer.
Fall Pippin, very fine,	Autumn.
Spice Sweet,	Autumn.
R. I. Greening, a good apple, but too tender for our climate.	
Early Harvest, good apple, but doesn't always succeed with us.	
Cooper's Market, medium apple.	
Rambo, medium apple.	
Early Joe, an inferior apple.	

Of crab apples, we find the Transcendant and the Montreal Beauty rapid growers and profuse bearers.

This list of apples will probably be considered meagre and imperfect. I may remark, as an excuse for its want of amplitude, that the information I have been enabled to obtain on the subject is scanty too.

I will only add to this portion of my subject, that it is generally allowed by us that a well drained loam soil, lying to the south-east, is the most favorable for orchards. The soil, of course, requires cultivating and manuring, and ashes are found to constitute a good fertilizer. Nor should the mulching of newly planted trees, nor constant pruning, as early as possible in the spring, be neglected. Where it is desirable to secure handsome specimens for exhibition or other exceptional purposes, the thinning out of the fruits, more especially the removal of such as are small or imperfect, must be attended to.

* Good keeping apples.
