Amatite ROOFING

Most roofings are made of only one layer but Amatite is made in Five Layers. The bottom layer is wool felt, the next is real Coal Tar Pitch, the third is wool felt, the fourth is pitch again, into which is embedded the fifth layer, namely, the Mineral Surface.

If the weather should, in the course of years wear away the mineral surface and dispose of the layer of Pitch (which is the most waterproof substance on earth), it would still

have to penetrate a layer of felt and another layer of composition and another layer of felt before the roof would leak.

It is easy to see why Amatite lasts so long when you realize how it is made.

That mineral surface requires no painting or coating whatever, and will take the brunt of the weather without renewal or attention or care.

Send for a sample of Amatite. It's free.
