came on. On these occasions the tumour inereased much in size, and again subsided as the pain went away. Tho usnal application mas a mustard pinster and some ordinary sedative. Within the last yenr she has had three or furr of theso attacke, and five months ago she was obliged to wean the baby in consequenco of the soverity of her sufferinge, With the excoption of these attacks of pain sho enjogs good heall h, although she has gradually lost flesh and strangth. Mer appotite continues good, she sleeps woll, and tho catamenia continut regular. The abdomen is not very much enlarged, being nbout the sizo it is at full torm, mea. suring thirty-fivo inches round the umbilicus and thirty-four abovo the pubes, and one and a half more on left side from ant. sup. spinous process of ilitm to umbilicus, than on the right. Two or three eysts appear to bo enlarging rapidly, fuectuation boing pereeptible in them. Sinee Christmas it has grown rapidly, for at that period it did not reach the umbilicus, whereas, it is now noarly as high as the cnsiform cartilago. There is no doubt as to its being a multilocular ovarian tumour, threo distinct cysts existing, besides numorous small and bard ones. It can casily bo moved from sido to side, shoving but fow, if any attachments. The uterus is normal, being very slightly larger than in tho virgin state, and no pain is experienced in making the pecessary examinations.

Thursday, April 30th, 1868.
A consultation having been ealled and an unanimons opinion given in favour of an operation-by Drs. Beaumont and Bovell; in the presonce of Drs. McKinnon and Balker, Army Medical Staff, and Drs. Agnow and Phillips, the operation was performed. Chloroform was given by Dr. Boreil, and she came casily uoder the iofluence of it. An incision about six inches long was made a littlo to the loft of the linea alba, botween the pubos and umbilicus, the peritonoum opened, and the whitish glistening tamour brought into viow. It was, as suspected, multilocular, two very largo cysts forming tho bulk of the mass, while incumberable small oysts from the sizo of a pea to that of a rralnut, gave the fecling above described. Tho largost cysts were tapped and yorerol quarts of eery viscid tenacious greenish fluid, is thick as honey flowed away. This fluid was glistoning with cholesterino. After the reduction in bulk by the omptying of the tro large
