The period determined from our own and Mount Wilson observations was 2.25960 days. Grouping the observations according to phase into 8 normal places as above, the following preliminary elements were obtained graphically.

$$P = 2.25960 \text{ days}$$

$$e = .05$$

$$\omega = 120^\circ$$

$$K = 105 \text{ km.}$$

$$\gamma = + 7.12 \text{ km.}$$

$$T = \text{J. D. } 2,419,031.596$$

Observation equations connecting the mean residuals with the elements  $\gamma, K, e, \omega$  and  $T$  were then built up and, with the substitutions

$$x = \delta\gamma$$

$$y = \delta K$$

$$z = K.\delta e$$

$$u = K.\delta\omega$$

$$v = [2.46688].\delta T$$

in the Lehmann-Filhés formula, the following observation equations resulted.
