the earliest varieties that can be had should be selected. Some of the earliest varieties have not been known to be attacked with disease, which probably may be accounted for upon the principle that the potatoes ripen, and the stalks become thoroughly dead, before the usual season arrives for the tubers to be attacked with disease. The use of gypsum, to be sown broad-cast upon the plants, when a few inches high, and frequent hoeing, either by hand or horse power, will hurry the crops forward to early maturity. It will be found, upon trial, that the great point to be aimed at, in the cultivation of this important
